THE SECOND PHASE OF A 3-YEAR STUDY TO DEFINE AN
OBJECTIVE FOR GUIDANCE SERVICES IS PRIMARILY CONCERNED WITH
THE INCLUSION OF TEACHERS IN GROUP COUNSELING AND THE
CONTINUED DEVELOPMENT OF GROUP COUNSELING WITH PARENTS. THE
22 PARTICIPATING SCHOOLS FROM SIX SCHOOL DISTRICTS IN
CALIFORNIA AND NEW MEXICO INCLUDED K-12 FROM ALL
SOCIOECONOMIC LEVELS. TO FACILITATE BOTH THE RESEARCH
PROCEDURE AND THE DATA PROCESSING, 10 DATA-COLLECTION
INSTRUMENTS WERE DEVELOPED, REFINED, AND USED WITH
INDIVIDUALS, GROUPS, AND SCHOOLS. A WIDE VARIETY OF DATA
RANGING FROM EXPRESSION OF ATTITUDE TO RATINGS OF OVERT
BEHAVIOR WAS COLLECTED AND STORED ON PUNCH CARDS. THE
ANALYSIS OF THESE DATA WAS CONDUCTED ACCORDING TO THE PATTERN
SET BY THE SPECIFIC MAJOR HYPOTHESES REGARDING CORRELATIONS
OF THE PERCEPTIONS OF STUDENTS, TEACHERS, AND PARENTS
CONCERNING APTITUDES, VOCATIONAL INTERESTS, AND STUDENT
SCHOLASTIC PERFORMANCE AS WELL AS THE RELATIONSHIP OF
EDUCATIONAL ATTITUDES, COMMUNITY ATTITUDES, AND PARENTAL
PARTICIPATION IN THE STUDY. ELEVEN VARIABLES WERE CONSIDERED
IN THE HYPOTHESES. ONE MAJOR HYPOTHESIS WAS CONCERNED WITH
THE EFFECTS COUNSELING WITH PARENTS AND TEACHERS HAS ON
STUDENTS. THE PRELIMINARY FINDINGS, ALTHOUGH PRIMARILY
ACTUARIAL IN NATURE AND NOT COMPLETE, PROVIDE SOME INDICATION
THAT THE GROUP APPROACH IS FEASIBLE FROM BOTH THE POINT OF
VIEW OF THE PUPIL PERSONNEL SPECIALIST AND THE DEGREE OF
PARENT PARTICIPATION. (AO)

PREFACE

This report is the second major publication of the Western Regional Center of the Interprofessional Research Commission on Pupil Personnel Services. The work described in this and the previous publication (Shaw and Tuel, 1964) is being carried out through a grant made available to the Commission by the National Institute of Mental Health. The main thrust of the Western Regional Center has been to propose a total rationale for guidance services and then to attempt experimentally to implement guidance programs in a manner consistent with that rationale. Because the concept of the "learning environment" is basic to the Project, and due to the fact that little work of a theoretical or research nature has been carried out relative to this concept, it has been also necessary for Project staff to devote considerable time and energy to this problem.

The initial publication of the Western Regional Center attempted to specify the rationale and to provide a model for the effective rendering of guidance services. It also attempted to delineate in a general way the research procedures that would be utilized. In the year intervening since publication of A Proposed Model and Research Design for Pupil Personnel Services in the Public Schools, research sites have been located and active steps to implement the design have been taken. This report represents an attempt to state more specifically the design of the Project, to report on the implementation of the design, and to present currently available data resulting from the Project.

ACKNOWLEDGEMENTS

As in any massive undertaking such as that represented by the present Project, it is almost impossible to do justice to all who should be acknowledged for their contribution. The greatest debt of gratitude is owed to those who have participated in this first active year of the Project as group discussion leaders. If it were not for the fact that these individuals are essentially highly motivated professionals, flexible enough to try a technique that was something new for nearly all of them, it would not have been possible to implement the Project at all. Not less essential was the valuable assistance rendered by several key educators who served as special consultants and advisers. Finally, an expression of gratitude is due to the graduate research assistants and secretarial staff of the Research Center. The names of these people are listed on the following page.

Thanks are due to administrative personnel at all levels in all participating districts. It will be all too clear in the following pages that the courage to try new procedures and an interest in contributing professionally over and above the ordinary rendering of services to children was not characteristic of all districts contacted. The highest administrative personnel in a number of districts were often the most reluctant to undertake participation in the present Project; therefore, those administrators who elected to volunteer their district or their school for participation are, in the estimation of Project staff, particularly worthy of commendation.

Certain individuals merit special mention because of their contributions to the current progress of the Project. Dr. Clarence Mahler, Professor of Psychology at Chico State College, Chico, California, was a primary consultant in the training of group discussion leaders. His success in this endeavor is

attested to by the positive feelings of all those group discussion leaders who had an opportunity to work with him. Dr. Stanley Caplan, Associate Professor, University of New Mexico, also merits special mention. His supervision of those who in turn were supervising the group discussion leaders in the Albuquerque area out of purely professional interests was a service far beyond the call of duty. Dr. D. H. Watson, Assistant Superintendent of Schools and Mrs. Camille McRae, Guidance Consultant of the Albuquerque City School District also should receive special mention. The distance of Albuquerque from Los Angeles has meant that certain members of the Pupil Personnel Staff of the Albuquerque Schools have had to assume a number of responsibilities connected with the Project which have been over and above their regular responsibilities. The importance of their contribution cannot be overestimated.

Finally, special acknowledgement should be made of the contributions of Mrs. Marrcele Ritter, Senior Administrative Assistant of the School of Education at UCLA, for her efforts in expediting all fiscal matters relating to the Project.

It has been a pleasure to work with all of these people, and members of the Project staff are looking forward to their next year of association with them.

CHAPTER I

INTRODUCTION

In a previous publication (Shaw and Tuel, 1964) a rationale for Public
School Guidance Services was presented. This rationale was accompanied by
a preliminary research design, the intent of which was to test the effective-
ness of the rationale in operation. In brief, this rationale attempted to ex-
plore the relationship of guidance services to the rest of the educational
enterprise and to define an objective for guidance services that would meet
the following tests:

1. An objective should be stated in clear and unequivocal terms.
   If it is necessary to use such ambiguous terms as "adjustment"
   or "self-understanding" then specific defintions of terms should
   be offered so that no doubt can be left as to their meaning.

2. Objectives should be stated in such a way that they will be
   open to assessment and evaluation.

3. Objectives established for guidance programs should be related
   to the commonly understood purposes of public education.

4. Objectives established for guidance programs should be feasible.

5. Any objectives established for guidance services should be stated
   in such terms that they are applicable at all academic levels and
   in all locations.

6. The objectives established for guidance programs should imply
   services which are both unique to the guidance profession and
   truly professional in nature.

An attempt was made to explore the present environmental press on public schools, and to critically examine the role of guidance services within this context. The incongruity of stating on the one hand that guidance personnel have a responsibility to all children, and taking the position on the other that we must work individually and directly with our clientele, was discussed. The varying roles of the teacher and the guidance specialist were examined with the conclusion that the teacher had primary responsibility for providing information, while the guidance specialist could most effectively fulfill his role in other ways.

The general lack of purpose exemplified by most guidance programs was mentioned, and the subsequent ineffectiveness of such programs was delineated. After exploring, very briefly, some of the generally accepted purposes of public education, the position was taken that "the overall responsibility of education that will find general agreement is -- that education must provide a situation, an atmosphere if you will, in which the skills and knowledges deemed by society important to learn can indeed be adequately learned in such a way that the student can put his knowlege to use." It was further postulated that the primary role of the guidance specialist was to "maximize the learning of all students, and to enable them to use their learning effectively".

The implications of this position were explored in some detail. A brief outline of these implications includes the following:

1. It is now possible to think of the major objectives of both elementary and secondary school guidance in similar terms.

2. Acceptance of such an objective would put the guidance staff into the mainstream of the learning process.

3. This objective clearly implies that the guidance specialist has a responsibility to all students.

4. The impossibility of working directly and individually with children only is made obvious. The need for working through the significant persons in the child's learning environment, namely, his parents and teachers, emerges as the only satisfactory solution.

5. Implementation of the proposed objective should make it clear to all that guidance services are not frills but are directly related to the learning of children in the public schools.

A very brief outline of the kind of guidance program which naturally follows from the above objective was presented. The importance of an active, as opposed to a passive, role for a guidance specialist was suggested. The need for the guidance specialist to seek out his clientele and to name his tasks, rather than waiting for these to be done for him by the weight of circumstances, was indicated

The Proposed Model

A model was proposed for an action research study which would progressively attempt to implement the proposed objective of guidance services. This attempt was, on the basis of initial understanding with the funding agency, to be an interdisciplinary approach involving as much of the full gamut of pupil personnel specialties as were available, consistent with quality of training and experience required to carry out necessary activities. It should be emphasized that the impossibility of totally implementing the suggested objective was clearly recognized by research staff due to the fact that already

established and functioning guidance programs existed in participating schools and that these could not be altered overnight to suit research purposes. Thus, only a fractional implementation would be possible during the life of the research grant. This fact alone would make difficult the collection of data demonstrating that guidance personnel can have a salutory impact on the learning environment of children. It should be emphasized that even statistically non-significant trends in resultant data may have practical significance with only fractional implementation of the proposed objectives.

The first year of implementation was limited to work with parent groups. The second year of implementation will continue work with parent groups and will be expanded to include systematic work with teachers. The final year of the Project will be utilized primarily to analyze data which should then be available. Only limited procedures involving additional data collection will be carried out during this final year. A revised schedule for the 51 months of the life of the Project is included in Appendix A.

In the time between the original exposition of the general design and the present, actual research sites have been located and activated and counselors to carry out the work of the Project have been trained and utilized. The diverse nature of the participating districts have necessitated some minor changes in design. A basic problem in this kind of undertaking is the question of where to draw the line between the needs of acceptable research design and the needs of the participating schools. It was necessary for the research staff to draw this line in several instances, including instances involving schools deeply committed to the Project. The outcome of this was the loss of some participating schools, even after they had begun implementation of research procedures.

In the interests of sound research design, the following "absolutes" were imposed upon participating schools and guidance specialists:

1. Work with parent groups would be carried out only at the first, seventh, and either ninth or tenth grade levels (depending on whether it was a three of four year high school).

2. It was necessary that participating guidance specialists agree to issue a blanket invitation to all parents in the appropriate grade in a participating school, not just to selected parents.

3. It was necessary that specialists agree to provide group counseling service to all parents who elected to participate.

4. Participating districts had to agree to the utilization of all Project assessment devices, under procedural conditions established by Project staff. These procedural conditions included the timing of the use of these instruments and the conditions under which they should be administered.

5. Attendance at a training workshop was specified as a condition for all participating specialists. Likewise, attendance at bi-weekly supervisory sessions was specified as a condition of participation.

6. These supervisory sessions were held in small groups rather than with the total group of participating specialists to make possible more effective supervision.

7. It was specified, and constantly reiterated by supervisory personnel, that parent group sessions must be non-didactic. Beyond this, no limits of procedure were established for any given specialist.

8. The specific number of group sessions to be offered to any given

parent, the procedure for series termination, and the method of reforming groups where marked attrition took place, were matters of procedure determined by Project staff.

9. The time at which groups should be initiated during the school year was determined by Project staff.

10. The method of adding new schools by already participating counselors and the timing of their addition was determined by Project staff.

In spite of clear directions given both in written form and verbally during the workshops and reinforced with subsequent written material, some problems relative to adherence to established research procedures appeared. Normally, Project staff became apprised of these conditions only after the act had taken place. The general result of these departures from established procedure was not so much to contaminate data, but rather to reduce the total amount of usable data.

Revisions Necessary Due to Actualities

The following changes have been made since the initial model was proposed:

1. There are differences in the number of schools involved at each level.

2. There are differences in the outcome criteria being utilized. The problem of outcome criteria is one which continues to plague those who do research in this area. A great many outcome criteria were initially proposed but, since the development of the original model, there has been a narrowing of focus with respect to outcome criteria. This narrowing has been necessary partly because of limitations in the kinds of information generally available in the schools, and

partly because of practical restrictions on the amount of instrumentation possible.

3. Another possible revision in t..e future may be the reduction of the number of participating school districts in the coming year. The unwieldiness of attempting to operate a demonstration project on a relatively limited basis in seven different school districts has become increasingly apparent to Project staff. For this reason consideration is being given to the possibility of reducing the number of participating districts in the coming year. Criteria for future participation would include:

   a. The degree of interest in continuation evidenced by a school district and the participating counselors in that district.

   b. The possibility of expanding the research effort to include additional counselors within a given district.

   c. The extent to which progress is being made in a given district in integrating the present approach into the regular guidance program.

4. Procedural changes in methods of collecting data from participants are necessary in order to obtain a higher proportion of data. These changes are of two general kinds. The first of these involves simplifying the role of participating specialists in the data collection process. The second change will be toward the collection of data from participating parents in person, rather than through the mail.

Summary

This chapter has reviewed the basic framework underlying the UCLA Guidance Research Project, sponsored by the Interprofessional Research Committee on Pupil Personnel Services. It was pointed out that, on the one hand, certain procedural modifications were necessary in this study as in all action research, but that on the other hand, it was possible to adhere to certain "absolutes" in the interests of acceptable research design. A weakness in the present investigation may be that it over-reaches itself. In attempting to test a total rationale for guidance programs on only a partial basis, there looms the real possibility that outcomes may not be as definitive as would be desirable.

CHAPTER II

PRELIMINARY PROCEDURES

The period from August 1, 1963 through August 30, 1964 was spent in resolving a variety of problems which beset the typical embryonic large scale research project, and in attempting to solve some which were unique to the present instance. Due to the time of year at which the grant became effective, it was extremely difficult to find appropriate personnel. Mainly through good fortune it became possible to employ an Associate Project Director by the end of September, 1963, and by this time clerical and graduate research staff had also been employed. The first ten months of the Project were devoted essentially to planning, site development and instrument development. In the process of planning, a publication entitled A Proposed Model and Research Design for Pupil Personnel Services in the Public Schools (Shaw and Tuel, 1964) was prepared and distributed. In addition, information about the Project was disseminated through presentations by the Director and Associate Director at a number of professional meetings.

The major facets of the planning process consisted of (1) the sharpening of research procedures, (2) the development of research sites, (3) the planning and conducting of counselor training workshops, and (4) the development of instruments to test outcome criteria. Each of these general topics, except the last, will be discussed in this chapter. Instrument development will be considered in a separate chapter.

Development of Research Procedures

During this the planning phase, it was necessary to specify in far greater detail than had been done previously the procedures to be used throughout the

life of the Project. Since the design was intimately related to the concept of the educational environment and the impact which pupil personnel specialists would be able to have on that environment, it was necessary to describe this environment and to attempt to develop instruments which would permit some assessment of certain aspects of it. A variety of philosophical, psychological, and sociological systems were explored, but none appeared to quite fit the purposes the investigators had in mind. The system which finally emerged was a unique development of this Project, and the concepts relating to the educational environment will be reviewed in more detail in the section on instrument development and in a separate publication. In addition to coming to grips with the definition of educational environment and the problems of assessment related to it, it was also necessary to develop other devices for measuring outcome and to establish data collection procedures.

Site Development

Publicizing the Project

Concurrent with the development of research procedures, preliminary steps were taken in order to ascertain which school districts might be interested in participating in a research project of this nature. Preliminary contacts with school districts were begun throughout the State of California. It soon became obvious, however, that the need for supervision would make it difficult, if not impossible, to operate effectively in school districts outside of relatively easy driving distance of the UCLA campus. For this reason, negotiations with districts outside of that radius were dropped even though considerable interest had been expressed by numbers of school districts across the country.

Contacts with school districts in the Los Angeles area were made in a variety of ways. A primary method of contact was through district personnel known personally to Project staff members, and other persons who had contacts in school districts. The third general way in which negotiations were initiated was for the school to contact some member of the Project staff, after having heard about the Project either through publication or through having attended a professional meeting where one or both of the investigators had described the research to be undertaken. In all, twenty-two districts in the Southern California area were actually visited by Project staff members. The number of visits per district ranged from one to six. This figure (22) does not include school districts with which there was preliminary contact that did not culminate in a visit.

Factors Affecting District Interest

Of the twenty-two school districts actually visited by Project personnel, nearly all expressed preliminary interest in the Project. In those districts (approximately half) where interest did not extend beyond the preliminary stage, a coolness toward the idea of participation was perceptible at rather specific points. These points included:

1) The point at which the individual being interviewed determined that funds would not be flowing directly into the school district.

2) The point at which the individual being interviewed first determined that the Project involved a rather radical departure from current guidance practices.

3) The point at which the individual being interviewed first became aware that parent participation was necessary.

4) The point at which the administrative officer being interviewed first determined that guidance staff would be called upon to do group counseling.

5) The point at which the individual being interviewed first determined that participating personnel specialists would need to work at night.

Initial interviews were held primarily with either directors of pupil personnel services, or directors of guidance. In only two instances did the initial interview involve a contact with an assistant superintendent, and in no case did it involve contact with the superintendent. As a matter of fact, in no district, including those who eventually elected to participate, did the investigators ever meet a superintendent during the preliminary stages.

In addition to the districts in Southern California, inquiries were received from a number of school districts throughout the United States. These districts had heard about the Project either through reports published by the central staff of the Interprofessional Research Commission on Pupil Personnel Services, or through copies of the Model which were mailed to key guidance personnel across the country. Inquiries relative to participation in the Project were received from as far away as New York, North Dakota, Oregon and New Mexico.

Much could be said of the visits made by the Project Director and Associate Director to the twenty-two districts in Southern California. Had it been possible to anticipate some of the kinds of situations arising, a tape recorder would have been a most useful tool, for certainly the material for a book was available in these interviews. Some of the most highly recommended directors of pupil personnel programs provided some of the major disappointments to the investigators. In several cases, a director quite plainly expressed the idea that he was satisfied with his program as it existed, saw no reason to do research that might upset it, and held that his major problem (if any) was the need to add more staff. One such director told the investigators, almost literally, "Don't call us, we'll call you." In another instance, they spent

two hours discussing the Project with a director of guidance who was most enthusiastic about it. The director indicated that he felt that the counseling staff in the secondary schools would also be enthusiastic about it. After two hours the director of pupil personnel services entered the meeting, and within a total elapsed time of three minutes had (1) completely thrown out any possibility of participating in the Project on the grounds that his counselors were incompetent to do what was required and (2) bluntly reprimanded his director of guidance for daring to show such interest. It is interesting to note that this director of pupil personnel services had been established long enough that he should have had some embarrassment about saying that his counselors were not competent to deal with parents.

Come of the initial contacts involved meetings with directors of guidance or head counselors and counseling staffs. One generalization from these experiences was that the enthusiasm of the counseling staff frequently exceeded that of the individual with administrative responsibility for the guidance program. In at least one situation where this was the case, a head counselor firmly vetoed the idea of participating in the Project over the consensus of his staff that they would like to participate.

When such site explorations were made, it was the policy of the investigators to present school participants in attendance with a copy of the Model and procedures and also with copies of evaluation devices, most of which were only tentative at that time. The absolutes delineated in the preceding chapter were carefully explained. In the case of schools visited in the fall and early winter, this material was not available and could not be placed in the hands of participants. Having it available in later interviews made the task of

explaining the Project and gaining cooperation somewhat easier. It was only through hard experience that it was learned that materials placed in appropriate hands were not always carefully read by those who received them. This turned out to be true in two of the seven participating school districts which, after having agreed to participate, having sent counselors for special training in the workshop, and actually having contacted parents for possible participation in group discussions, apparently read the evaluation devices for the first time and abruptly decided that it would not be possible for them to participate if these devices were a necessary part of the Project.

In some districts the response was enthusiastic and a desire was expressed on the part of the district personnel to have large scale involvement of their pupil personnel staff. Heavy participation by any single district was discouraged by Project staff because of the desire to involve several districts, which in turn limited the funds available for any single district. Thus, actual numbers of individuals participating could have been considerably larger than those to which they were limited, were it not for financial limitations.

Approximately half of the districts actually visited expressed a substantial degree of interest in the Project. Of these, six were chosen in the Southern California area for actual participation. Most districts eliminated from consideration were dropped because they did not have personnel with a minimum of training which would insure competency or because further investigation revealed that the district had a history of undercutting pupil personnel services, thus reducing, not only chances for adequate implementation of Project procedures, but also the possibility that new knowledge stemming from the Project would be incorporated into the ongoing guidance program.

National Interest in the Project

In addition to investigating a large number of school districts in the Los Angeles area, inquiries arrived from school districts all over the country as information about the Project and its purposes became more widespread. It was necessary, in most instances, to refuse these generous offers of cooperation due to a whole host of factors, including financial limitations, administrative problems, and the non-availability of supervision in those districts removed by long distances from the Los Angeles area. In the case of one such district, however, all factors were favorable. There was enthusiastic endorsement of the purposes of the Project from the superintendent on down; there existed an active pupil personnel program which had had vigorous leadership; and there existed a cadre of personnel workers skilled in the use of group techniques. In addition, supervisory help of the very highest caliber was available in the district. In view of these circumstances, this district (Albuquerque, New Mexico) was admitted as a participant in the Guidance Research Project.

In order to determine the appropriateness of both district participation and pupil personnel specialist participation, forms were developed which would provide certain information on each prospective participant. The data obtained from these forms is summarized in Chapter VI. A copy of the form will be found in Appendix B. After receiving a definite expression of interest in participation, and after investigating factors which Project staff believed to be relevant to adequate functioning, districts were notified of their acceptance as Project participants through a letter to the individual designated by the district as the contact person, and each individual participating specialist was individually notified of his selection. Although a selection function was

exercised by the investigators, it appeared that the self-selection which took place when individual pupil personnel specialists elected to participate or not to participate in the Project was of great importance in providing high quality participating specialists.

Suggestions for the Future

The time consuming, tedious, and at times disheartening experience of developing research sites resulted in two pieces of hard-won knowledge on the part of the Project staff. It might save others who anticipate engaging in a similar endeavor some time and trouble if these were stated. While they cannot be considered empirical, they are important by-products of the current research effort. The first suggestion which the investigators would have to make is that initial contact regarding the participation of a school district in a sizable research project should always be made with the superintendent and with no one else. It is perfectly proper to utilize someone in the district known to the researcher as a point of preliminary contact, but when it comes to discussing actual participation and the burdens which the district will have to bear, no one of lower rank than superintendent is capable of responding adequately and of definitely committing the district to participation. A second piece of information relative to the same point is that the agreement of the district to participate in the Project should be secured in writing. This is not so much with a view to making a legally binding commitment, but rather to insure that appropriate district officials will thoroughly familiarize themselves with the research procedures and with the obligations that the district is incurring through its agreement to participate. In the present research, two of seven districts indicated, well after the Project was underway, that they

would not utilize certain data collection procedures which they had previously been informed would be necessary. They were willing to do everything else but not these specific things. As a result, it was necessary for Project staff to end the participation of these districts, and the research effort was unnecessarily handicapped.

The Counselor-Training Workshops

The Need for Special Training

An important part of the research design involved the provision of a brief but intensive series of training sessions for all participating guidance specialists. Although participants had been carefully screened and were cooperating with the research staff on a volunteer basis, they had, as a group, relatively little experience in group procedures. Thus, one of the prime purposes of the workshops was to provide them an opportunity to learn from experts some of the fundamentals of group counseling. The second purpose of the workshops was to acquaint participating specialists with the research design and procedures and with the rationale underlying the design. Since these guidance specialists would be the ones primarily responsible for actual collection of data, it was imperative that they have a precise understanding of the procedures to be used and how they were to be implemented. (The names of all participants are listed in the acknowledgements.)

Organization of the Workshops

Because of the fact that two widely separated groups of counselors were participating in the research project, it was necessary to hold two different workshops. The Los Angeles Workshop was held through the five day period from June 21-25, 1964 on the UCLA campus. Half of the participating consultants were

housed in University dormitory facilities and remained full time on campus.
Those within easy driving distance of the University commuted daily. Actual
workshop sessions were held in the conference rooms of the residence halls where
excellent facilities for this purpose were available. Dr. Clarence Mahler, an
expert in the use of group procedures in schools, served as chief consultant in
the training of counselors for work as parent-discussion group leaders. All
twenty-five participating counselors attended this workshop. Because the summer
session of all major institutions in the Los Angeles area began on the opening
day of the workshop, some counselors attended the workshop at the expense of
missing a full week of academic work.

The Albuquerque Area Workshop was held over a two-day period in the central
administrative offices of the Albuquerque Unified School District. Special
circumstances conspired to make this workshop shorter and less intensive than
that for the Los Angeles participants. Chief among these reasons was the fact
that negotiations with Albuquerque were concluded so late in the school year
that there was no possibility of getting together any significant group of par-
ticipating counselors through the summer months. An additional complicating
factor was that the necessity of holding two different workshops was not con-
templated at the time funds were allocated for workshop purposes. For these two
reasons the Albuquerque Workshop was not only shorter, but also did not involve
counselors living-in at the workshop site. The same consultant in group pro-
cedures served in both the Los Angeles and Albuquerque Workshops. However, in
the case of the Albuquerque Workshop, Dr. Stanley Caplan, Associate Professor,
University of New Mexico, also an expert in group procedures, served as co-
consultant with him.

The U.C.L.A. Workshop

In order to involve the participants in the actual counseling process, it was necessary to group them in some practical manner. The most meaningful way to make this division was to separate the elementary and secondary school participants. In addition to creating two groups approximately equal in size to the groups which would be handled by the participants, this division also enabled the workshop staff to deal separately with the different problems of data collection on the elementary and secondary school levels. Generally speaking, one half of each day was spent by each guidance specialist in actual participation in groups and in becoming more sophisticated in the use of group techniques. The other half of each day was devoted to somewhat more didactic sessions dealing with the rationale, research design, and data collection aspects of the Project. The schedule of actual time usage is included in Appendix C. The living-in arrangement which most specialists were able to take advantage of was of prime importance. Informal discussion sessions after the close of regular workshop hours appeared to add greatly to the impact of the workshop.

Although it is only a subjective observation, those responsible for conducting the workshop agree that, while the participants arrived at the workshop interested in the Project, they left _enthusiastic_ about it. This enthusiasm has continued through the first half of the first year of actual experimentation and has been especially manifest in the disappointment of participants whose administrators have refused to honor their original commitments, and thus have forced Project staff to withdraw from their schools.

Each attendant at the Los Angeles Area Workshop was presented with a copy of the publication entitled, A Proposed Model and Research Design For Pupil Personnel Services in the Public Schools (Shaw and Tuel, 1964), and with a binder

containing ceveral kinds of materials, including the workshop schedule, the names
of other participants, copies of evaluation instruments, the data collection
schedule, models of appropriate letters to parents, and appropriate materials on
group counseling taken from the literature and prepared by Project staff. Copies
of the evaluation instruments will be found in Appendices F through K. Copies
of materials prepared by Project staff which were presented to the participants
at the workshop sessions will be found in Appendix C. Other materials utilized
included "Encouraging Children To Learn: The Encouragement Process," by Dinkmeyer
and Dreikurs, and a speech entitled, "Basic Principles in Dealing With Children,"
delivered by Dr. Rudolph Dreikurs to the Special Services Staff of the Torrance
(California) Unified School District. All of the materials relating to data
collection were reviewed in the formal workshop sessions. The materials from
the literature were referred to, but not reviewed formally; participants made
use of these kinds of materials in their hours outside of regular workshop
sessions.

The Albuquerque Workshop

As mentioned above, the workshop held for participating guidance specialists
in the Albuquerque School District was both briefer and less intensive than that
held for the participants from the six Los Angeles area school districts. In
spite of its briefer duration, this workshop had the same general purposes as
the Los Angeles Area Workshop. Through utilizing an additional expert in group
process, it was possible to compensate for brevity. There was also one evening
session at which a group of eight parents actually participated in a counseling
session while being observed by all Project participants in the Albuquerque area.

The Albuquerque participants were provided with exactly the same sets of material as had been provided to the Los Angeles participants. Because of the distance of Project staff from Albuquerque, it was impossible for them to form any valid, first hand opinion of the impact of the workshop on Albuquerque participants. Supervisors in the Albuquerque area, however, reported great enthusiasm, both among participating guidance specialists and in participating schools generally. It was reported that the staffs of some schools actually felt hurt at being left out of the Project in the first year of operation in Albuquerque.

It has become obvious to Project staff that it will be necessary, both for purposes of morale and control, to hold workshops in the Los Angeles and Albuquerque areas which are similar, not only in material and personnel, but in length and intensity. In addition, they should be held at approximately the same time of year. Plans are currently underway to meet the needs observed as a result of last Spring's experience with the workshops.

CHAPTER III

INSTRUMENT DEVELOPMENT

At the beginning of the Project, three special considerations with respect to instrumentation confronted the investigators. The _first_ of these special considerations was that this was to be a unique Project with rather unique objectives, a situation which necessitated the development of special instruments for the evaluation of outcomes. After careful exploration of the possibility of utilizing already existing instruments, it was evident that, with the exception of the Parent Attitude Research Inventory, developed by Schneffer and Bell (1958), techniques of evaluation would have to be developed by the investigators themselves. The _second_ consideration was the fact that material from certain samples would, of necessity, have to be collected through the mail. This contingency imposed certain restrictions upon the data collection process. The _third_ general consideration was that the Project was being carried out in certain districts where, for good and sufficient reasons, there was real sensitivity on the part of the school system personnel to public criticism.

With these three general considerations in mind, six specific criteria, apart from the usual criteria of reliability and validity, were agreed upon. The _first_ of these special criteria had to do with the fact that it would be necessary to process large quantities of data. It was, therefore, desirable from the point of view of accuracy and efficiency to utilize a collection technique which would permit the direct automated translation of responses into analyzable form. A _second_ factor taken into account was time demand.

Parents are frequently sensitive about receiving materials through the mail from the schools which will require a great deal of time to complete. They may react to such material either by ignoring it or through protest to the responsible authorities in the school system. In either case, the outcome is undesirable from a research point of view. Related to this general problem is a __third__ criterion of instrument construction, that of covenience of handling. This is a two-way problem since material should be convenient to handle for mailing and should be convenient for the respondent as well. Both the mark sense card system and the optical page reading system were considered. The mark sense card system was tried out with mailed data, but the proportion of response was such as to make the Project staff suspect that the need to use a special pencil (which was mailed with the forms) and the inconvenience involved in using five different IBM cards, which were separate from the question blanks, had helped to create a negative reaction in the respondents, which in turn resulted in a relatively low proportion of response. From the point of view of Project staff, it was simpler and less expensive to handle material which did not call for the use of a special pencil. A __fourth__ consideration was the need for simplicity in responding to the evaluative material. The use of separate answer sheets or cards and the need to utilize special materials such as an electrographic pencil, seemed unnecessarily complex. A trial run evoked the suspicion that cards could become mixed up during the taking of the inventory and result in spurious data. The __fifth__ special consideration was that of cost. All other things being equal, it was felt that cost should be held to a minimum.

The system which the investigators judged best capable of meeting all of these special demands was the IBM optical page reading system, which employs special combined questionnaire - answer sheets which can be processed through the IBM 1230 Optical Page Reader. This system has the advantages of (1) accepting marks made by an ordinary soft lead pencil, (2) accepting sheets which have been folded in mailing, (3) combining questions and answer spaces on one sheet, and (4) automatically punching cards from marked data.

The sixth special requirement, though related less to administrative matters, was of prime importance. This requirement was that there should be general acceptance of the evaluative materials even on the part of non-participating parents who were being used as controls and on the part of teachers in the participating schools, as well as on the part of parent participants and students. The creation of attitudes of suspicion or hostility would be inimical to the general aims of the research. It was recognized that it would not be possible to overcome this problem completely, but at the same time care was taken to avoid unnecessary offense to those who might respond. It was noted by Project staff that negative responses to Project material, which were reported, seemed to come from a very tiny proportion of the total population, and that, when such objections were handled firmly by responsible school officials, they did not damage either the school system or the Project.

Individual Data Collection Instruments

The Student Data Summary (SDS)

In order to collect such background data, grade point average, standardized test scores and behavior ratings as might be found in the individual

student's cumulative record, a special form was devised using a format scorable by the 1230 Optical Page Reader. This form was used by members of the Project staff in on-site recording of certain data abstracted from school records. A copy of the SDS is included in Appendix F.

School Opinion Survey (SOS)

In the absence of any comparable instrument, the investigators developed a broad spectrum multiscale opinionnaire which could be administered to all five educational role groups, i.e., teachers, counselors, administrators, parents and older students. Beginning with a pool of over 300 items dealing with educational issues drawn from the literature, they reduced these through preliminary testing to 250 items. These items formed the original instrument, the School Opinion Survey, Form A. Form A was then administered to all teachers, counselors and administrators, and to all tenth grade students and parents in a medium sized California city school district. The resulting data were factor analyzed and subjected to tests of differences between subgroups.

Ten strong factors emerged (see Table 1). The ten items in each scale which exhibited the greatest loadings were selected and used to construct a revised version of the instrument composed of 100 items, Form B. Form B was then printed in the special format necessary to be read by the IBM 1230 Optical Page Reader. (A copy of this form may be found in Appendix G.) It was this form which was used as the research instrument during the school year 1964-65. It is anticipated that the data collected during this period will soon permit preparation of a _Manual for the School Opinion Survey_.

Because five items touching on religious opinion drew fire in a few scattered instances, it was decided to reduce criticism in this regard by

revising the Experimental Scale. The result of this revision, Form C, will be used in most future applications of the instrument.

Family Life Attitude Inventory (FLAI)*

The major development work on this instrument was done by Schaeffer, Bell and Bailey. They developed two forms of the instrument, a form for mothers and a form for fathers. The mother form contained 115 items and the father form 240 items. The mother form consisted of 23 scales of five items each, while the father form consisted of 30 scales of eight items each. The scales were developed through use of factor analysis, and built on a circumplex model. Although there are separate scales for mothers and fathers, there is a great deal of overlap both with respect to subscale titles and specific item content. Taking advantage of this situation, the present researchers appropriated the 14 scales which appeared on both mother and father forms of the inventory and reduced each scale to seven items (to keep the total number of items under 100). It was necessary to rewrite some items to reflect the common gender. The 14 scales included on the present modification are indicated in Table 2 along with the scale number they represent on the original father and mother forms of the PARI. Table 2 also gives the scale names and the corresponding items on the UCLA form of the PARI (FLAI). A copy of the FLAI will be found in Appendix H.

The items included in the FLAI and their equivalent items on the original PARI forms are indicated in Table 3. The term "equivalent" is broadly interpreted here, and does not, at this stage of the research, imply statistical equivalence.

The Educational-Vocational Plans Iventory (EVPI)

In order to meet the special evaluation needs posed by parent discussion groups at the high school level, where emphasis was placed on educational-vocational planning, it was necessary to develop an instrument which would reflect some of the areas around which parent discussion would center. The EVPI was developed to meet this need. This instrument, like the SOS and the FLAI, was designed to be processed through the 1230 Optical Page Reader. It focuses on the areas of ability and interest, and was designed to reflect both the subjective opinions of the respondent and his more factual knowledge of his own abilities and interests. Since this instrument was to be utilized in high school parent discussion groups, and with high school students, the questions relating to interests were built around the interest categories of the Kuder Preference Record (Vocational).

The EVPI has been used, not only as a measure of change occuring in parent participants, but also as a base line to determine the equivalence of participating and non-participating parent groups with respect to the objectivity of their knowledge about their children's interests and abilities. It will also be used with control parents to determine whether or not changes have taken place in the non-participating groups.

Two forms of the EVPI were developed: Form S for students and Form P for parents. Items are identical in content on the two forms except that the student form requires a first person response, while parents are asked to answer the questionnaire with reference to their children. Completion of the form takes from five to ten minutes. A copy of both forms of the EVPI will be found in Appendix I.

Group Data Collection Instruments

The Post Series Reaction Sheet (PSRS)

This instrument was developed to assess the subjective responses of participating parents to their experience in the discussion groups. According to some authorities, one of the major criteria of the success of counseling is the response of those who participate in it. With this in mind, the PSRS was designed to measure in several ways the valence of parental reaction to their experience. It was felt necessary to design an instrument that would permit respondents to reply in open-ended fashion to at least some of the items. Because of this, the PSRS was not designed for scanning by the Optical Page Reader, but requires manual key punching of data in IBM cards. A copy of the PSRS will be found in Appendix J.

The Group Attendance Form (GAF)

This form was designed to enable counselors to keep track of the attendance of their participating parents, and to provide data relevant to parent attrition. It was turned in by counselors upon completion of each group series. A copy of the GAF is included in Appendix J.

The Counselor Response Forms (CRSG and GCR)

It was anticipated at the outset that most of the counselors participating in this Project would have had little experience in group work. It was hoped that substantial numbers of those who participated in the first year of the Project would elect to do so in a second year. For this reason, a record of attitude change on the part of the counselors as they gained additional ex-

perience in group counseling was desirable. In addition, counselor reactions to their experience as group leaders were deemed desirable partly because such information could assist in the evaluation of outcomes, and partly because it could be of help in modifying procedures. Two forms were developed to accomplish these purposes. The first of these was called Counselor Reactions to Specific Groups (CRSG). Each counselor was required to complete one of these forms at the termination of each series in which he was a group leader. The second form was called General Counselor Reactions (GCR), and was completed by each counselor after all of his group work had been terminated for the year. In the case of both forms, open-ended items were used, and for this reason it was not possible to utilize the optical page reading system. An additional reason for not utilizing this or any other mechanical system of data tabulation was the relatively small numbers of forms to be processed. Copies of the CRSG and GCR will be found in Appendices J and K respectively.

School Data Collection Instruments

The Parent Response Form (PRF) and the Community Evaluation Blank (CEB)

Two special forms were devised for the collection of general school and community data. The first of these was called the Parent Response Form (PRF). This form was completed by each participating consultant after he had sent letters inviting parents to participate and had received all postal reply cards or slips which were going to be returned.* It enabled each counselor to

---

* Initial experience indicated that this form could be more reliably completed by Project staff.

summarize the number of parents contacted, those who responded, those who did not respond, and the nature of the response.

The second special form was the Community Evaluation Blank (CEB). This form utilized to collect information descriptive of the size and socio-economic and ethnic status of the clientele of participating schools. It was completed by the principal of each school. Copies of both of these special data collection forms will be found in Appendix K.

CHAPTER IV

RESEARCH PROCEDURE

Selection of participating school districts, training of participating consultants and development of instruments only set the stage for the actual program of research. It still remained to prepare the "script", i.e., the actual detailed procedure by which a controlled study could be conducted. It is frequently at this point that many otherwise well conceived investigations break down and that fatal contaminations and losses of data gain entrance. Each step of the research procedure was, therefore, given painstaking scrutiny by the investigators. Extreme care, of course, does not assure perfection. Doubtless, numerous flaws remain which eluded the authors but will be all too apparent to many trained observers.

The major phases of the research procedure were (a) parent group enrollment procedure, (b) individual data collection procedure, (c) group data collection procedure, and (d) data processing procedure. A section of the chapter will be devoted to each of these phases.

Parent Group Enrollment Procedure

Six steps were necessary to establish the parent groups (See Diagram 1). These were (1) printing of post cards, return envelopes and parent letters, (2) preparation of the Student-Parent Lists, (3) mailing the Invitation Letters, (4) enrollment of respondents, (5) mailing Follow-up Letters and (6) follow-up phone calls. The various printed materials used in conjunction with these steps may be found in Appendix D.

1. The Research Center Staff designed, printed and distributed pre-paid post cards for the parents to respond to the invitation letter. Provision was made on the card for parents to indicate whether father, mother, both parents or neither parent planned to attend, and which night of the week was preferred for the group meeting. Each school stamped its own address on the cards which it sent out. Business reply envelopes addressed to the Research Center were also printed for enclosure with the second (Follow-up) letter. Three sample parent letters were prepared for local approval and duplication by each district. These were the initial Invitation Letter "I", the participating-parent Follow-up Letter "P" and the non-participating parent Follow-up Letter "N". These materials were then delivered in the needed amounts to the consultants.

2. A list of names and addresses of children who were then at the specified grade level together with the names of their parents were compiled under the direction of the consultant(s) responsible for each school. This was known as the Student-Parent List. Two envelopes for each family were addressed from this list, one set for each mailing. A copy of each Student-Parent List (Appendix E) was transmitted to the Research Center by the responsible consultant.

3. The initial Invitation Letters "I" inviting the parents to participate in the groups were submitted for district approval, revised as needed, reproduced and signed by the administrator. One of these, together with a printed post card for the parents to reply was stuffed into each pre-addressed envelope and mailed.

4. As the cards were returned, replies were tabulated and a mark placed next to each family name indicating whether (1) father only, (2) mother only, (3) both parents, or (4) neither parent planned to attend. After replies ceased coming in (about two weeks), those families were placed in category (5), "no response," from whom no card had been received. Frequencies of response in each category were then recorded on the Parent Response Form (Appendix K) and transmitted to the Research Center. Parents answering in categories (1), (2), and (3) were enrolled in groups meeting on the evening for which they had indicated preference on the returned card. A Group Attendance Form (Appendix J) was prepared for each group so constituted, listing the parents who had enrolled. Where the positive response was too small, it was necessary for consultants to include additional schools. When too many parents signed up, a sample of them selected randomly was assigned to a "wait list," informed that they would be enrolled in a group meeting later in the year and these parents were employed as a control group to test the hypothesis that changes observed in the immediately started group could have been due to general influences extrinsic to the actual group experience.

5. The second set of letters was prepared. For enrolled parents Follow-up Letter "P" thanking parents for their response and informing them of the exact time and place of the meeting was prepared and signed. This letter also contained a request for them to complete and return the enclosed questionnaires. The appropriate one of these two letters was stuffed together with the questionnaires and a business

reply envelope addressed to the Research Center in each of the second set of pre-addressed envelopes and mailed.

6. Follow-up contacts by telephone were found to be effective in increasing the rate of attendance among parents who had promised to come. This procedure, however, was not a required feature of the design and was not employed by all cooperating schools.

Individual Data Collection Procedure

It was imperative to the design that preassessment of the attitudes of parents, teachers, administrators, counselors and high school students be accomplished before the experimental intervention, i.e., the commencement of the group series. It was also desirable to collect behavioral data on the student sample as early as possible in the sequence. Four special instruments, previously described, were used for this purpose. These were the School Opinion Survey (SOS), the Family Life Attitude Inventory (FLAI), the Educational-Vocational Plans Inventory (EVPI) and the Student Data Summary (SDS). (Copies of these instruments are included in Appendices G, H, I and F respectively.) This initial assessment was undertaken in the following manner for each role group (See Diagram 2).

The assessment of parent attitudes necessarily had to be conducted by mail.* As described above, the instruments used for the assessment were enclosed with the second letter mailed by the school to the entire sample of

---

* An exception was one participating district whose regulations prohibited mailing such material. There, participating parents were handed the material in person in a group session prior to the beginning of parent group dis-.s cussions.

parents. It was expected that the percentage of response would leave something to be desired especially among those parents who had elected not to participate in the groups or had not even returned the post card. However, it was considered important to seek some index of the way opinion patterns might differ among those parents participating, declining to participate or simply not responding. Parents of elementary and junior high children were sent the SOS and the FLAI. Parents of high school students were sent the SOS and the EVPI (Parent Form). Processing of returned questionnaires will be described below.

Teachers were given the SOS by the staff consultant in their school, preferably at a faculty meeting where its purpose had been explained. They were asked to return it unsigned to the Research Center in the business reply envelope provided. The wide spread concern among teachers about "evaluation" made it advisable to permit anonymity for this group. Only the school from which the response came was recorded.

The principal of each participating school was sent a letter thanking him for his school's participation and requesting him to complete and return the enclosed SOS in the UCLA reply envelope.

Each staff consultant also filled out the SOS and returned it to the Research Center.

In each participating high school, all students in the freshman class (ninth or tenth grade) completed the SOS and EVPI (Student Form). Commonly, this was done during an English or Social Studies class. The student placed his name on the forms. After collection by the consultant these were delivered as a package to the Center. In addition, important data on the students

was transferred from the school records to the special Student Data Summary form by a Staff Research Assistant (See Diagram 3).

Group Data Collection Procedure

In addition to the four individual instruments whose use was described above, six assessment devices were employed to collect data at the community, school and group levels. The development of these instruments was described in an earlier chapter. They were (1) the Community Evaluation Blank (CEB), (2) the Parent Response Form (PRF), (3) the General Counselor Reactions form (GCR), (4) the Counselor Reactions to Specific Group form (CRSG), (5) the Group Attendance Form (GAF) and (6) the Post Series Reaction Sheet (PSRS). (Copies of these instruments are included in Appendices J and K.) The procedure for collecting group data by means of these devices will be described below (See Diagram 4).

The Community Evaluation Blank was delivered to the principal by the responsible consultant with the request that he have it completed and mail it in the envelope addressed the Research Center. The nature of the information requested on this form was such that it could best be completed by a clerk in the principal's office.

The Parent Response Form was filled out by the responsible consultant when tabulations of parent responses to the initial Invitation Letter were complete (See Diagram 1) and was mailed to the Center.

The General Counselor Reactions form was filled out by each consultant at the end of the school year.

One <u>Counselor Reactions to Specific Group</u> form was completed by each consultant at the end of each group series, separately for each group, and forwarded to the Center with the GAF and PSRS forms collected from the group members.

One <u>Group Attendance Form</u> was kept by each consultant for each group and forwarded to the Center at the end of each series.

One <u>Post Series Reaction Sheet</u> was completed by each group member at the last meeting of each series, signed, sealed in an envelope, collected by the consultant and forwarded to the Center. An attempt was made by each consultant to get parents who had dropped out before the last meeting to complete and return the form. Forms were pre-identified by school before distribution.

<p align="center">Data Processing Procedure</p>

The processing of the individual attitude questionnaires and Student Data Summary (SOS, FLAI, EVPI and SDS) was facilitated by the special format in which they were printed. This format made it possible to transfer the data from these forms directly to punch cards, without the services of a key punch operator, by passing the forms through an IBM Optical Page Reader. On the other hand, data from the six group forms which were not prepared in this manner, still had to be key punched. Three phases were necessary in the processing: (1) identification and sorting of returned forms, (2) preparation of forms for translation to cards and (3) the actual translation of data to the punch cards. The sequence of operations used within these phases was as follows (See Diagram 5):

DIAGRAM 5

SCHEMATIC DIAGRAM

OF DATA PROCESSING PROCEDURE
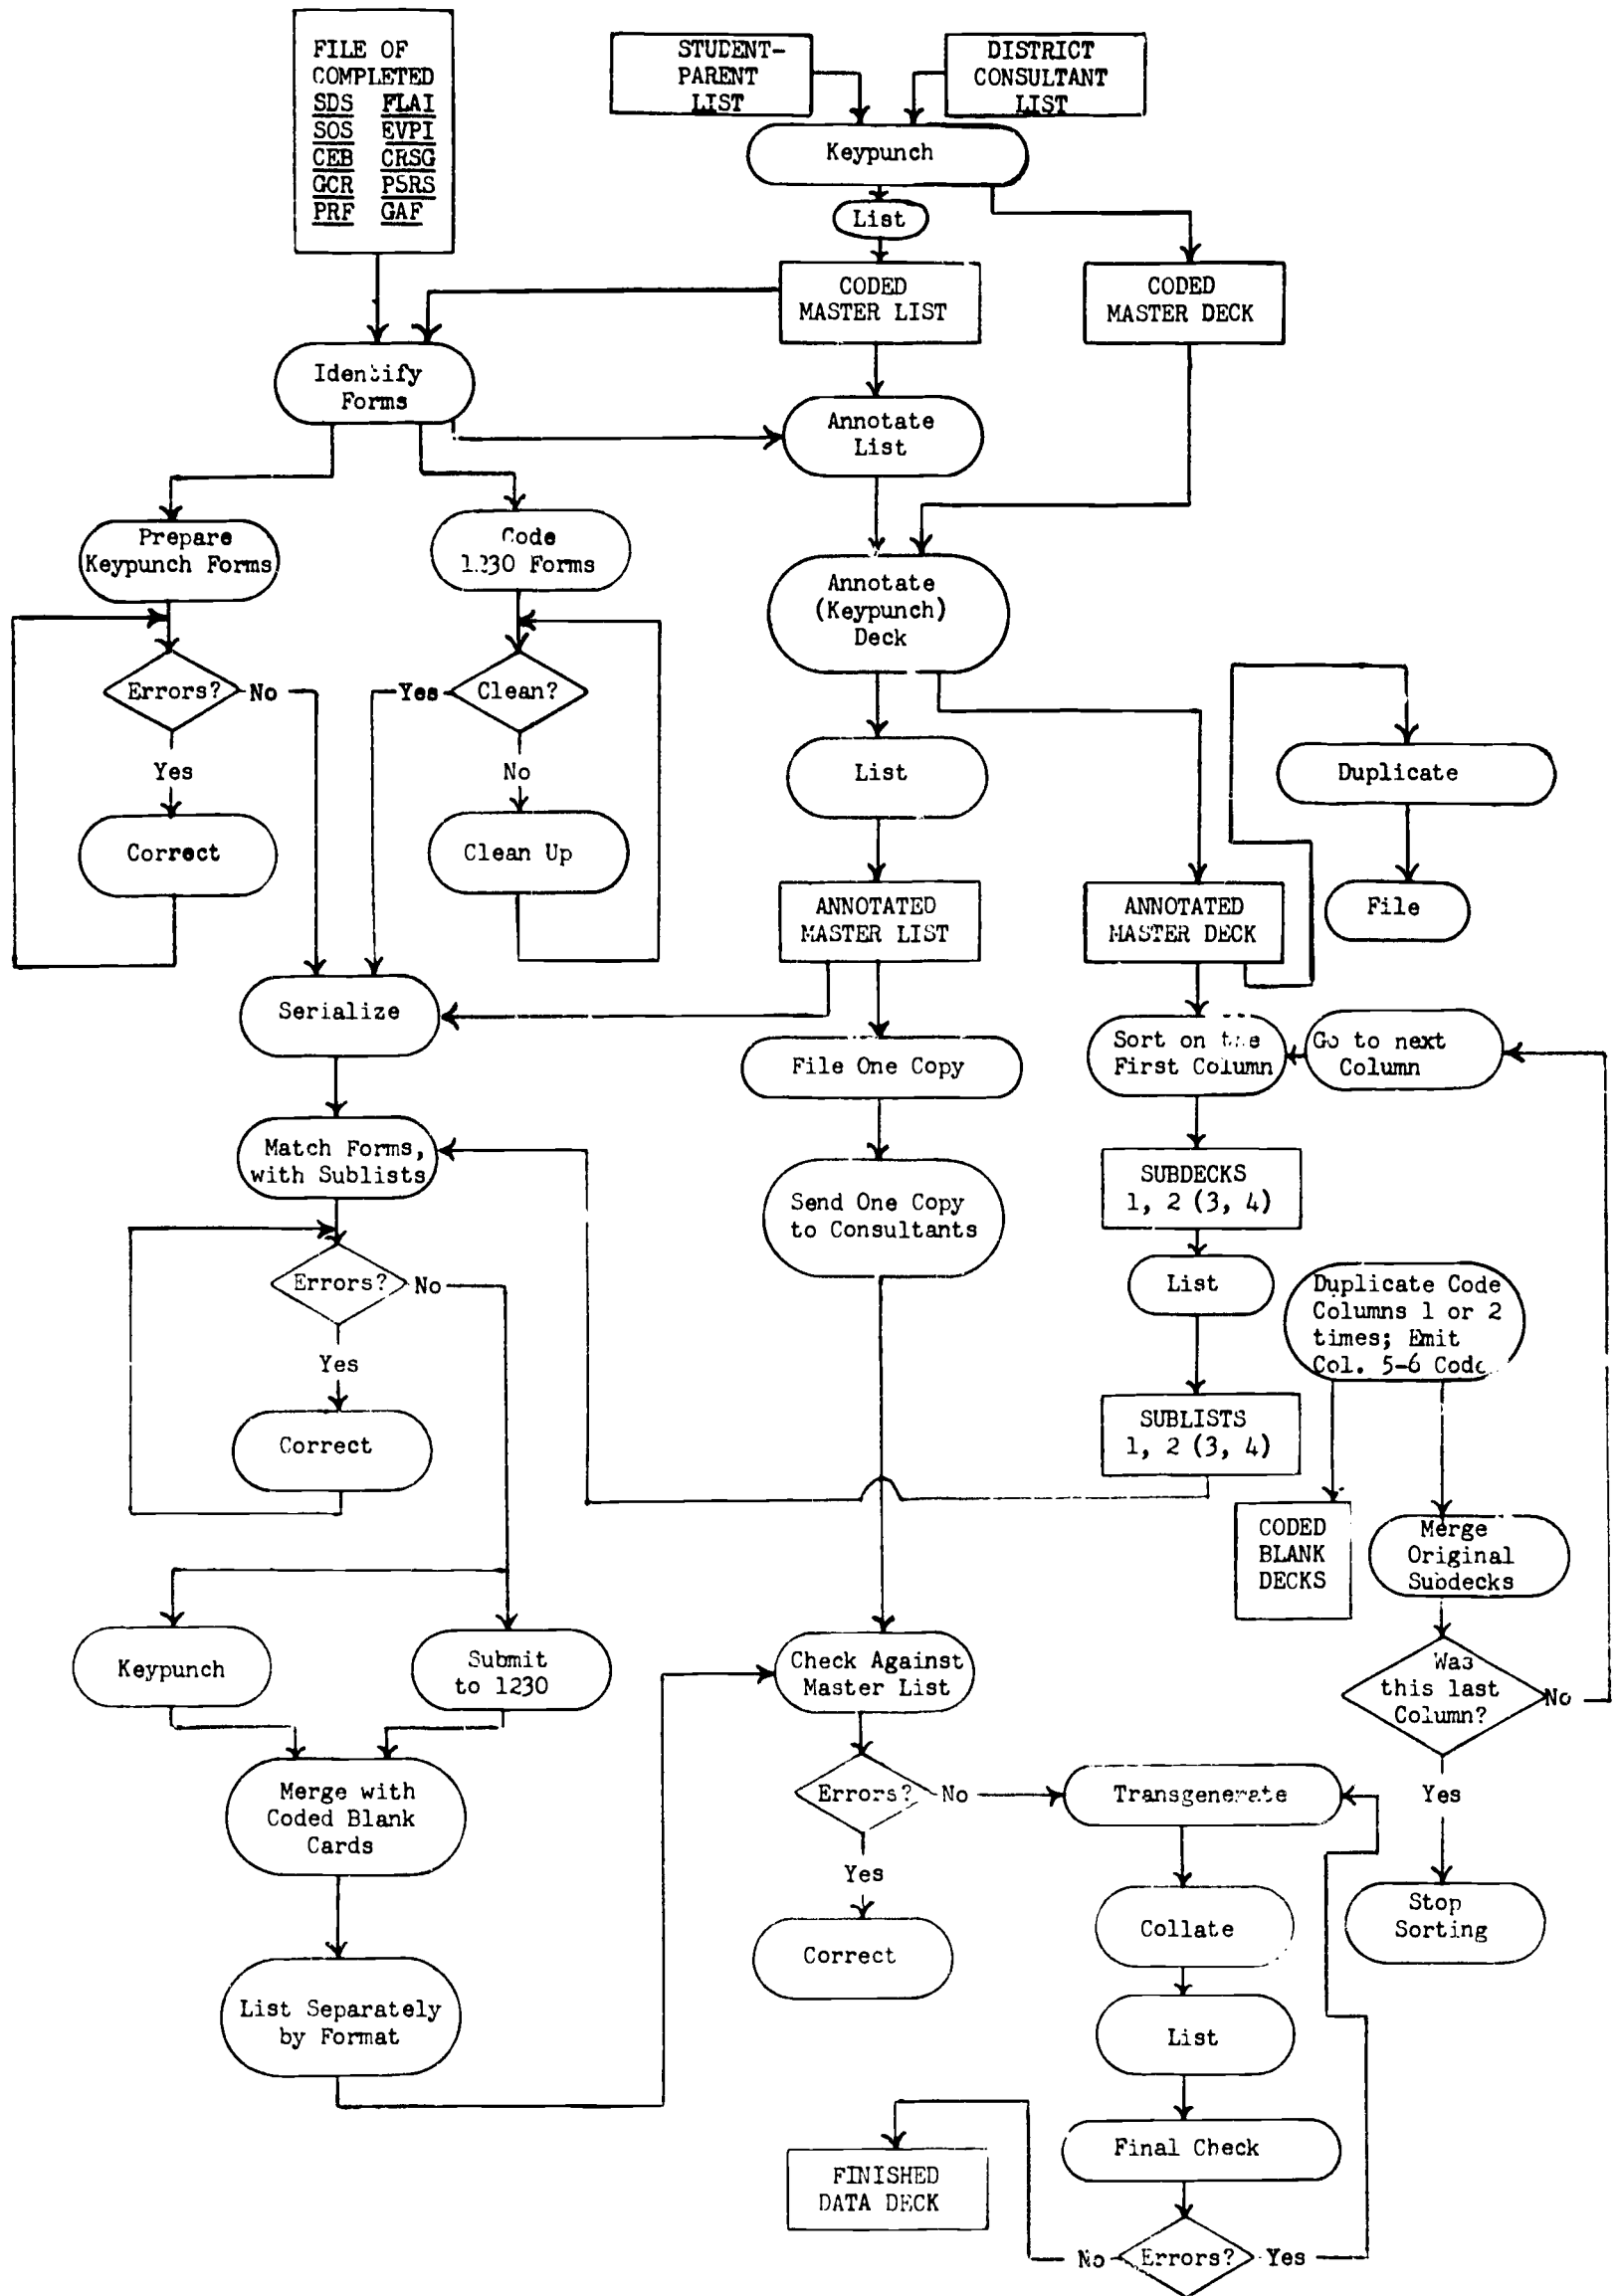

1. <u>Procedure for identification and sorting of returned forms</u>:

(a) First, the <u>District-Consultant List</u> was set up, consisting of the names of all participating districts with the names of those Project consultants employed by each. (See Appendix E). Each district was assigned a code number as listed in Table 4 and each consultant within that district was assigned one or more numbers, depending on the number of participating schools he served. The appropriate pair of these numbers, termed the <u>District-Consultant Code</u>, was later punched into columns 1 and 2 respectively of all data cards and served to identify the district, consultant and school from which data had come. (Consult Table 4 for a summary of the complete file number scheme.)

(b) Next, the Student-Parent Lists were composed. One such list was provided for each school by the responsible consultant. A special form was provided (Appendix E) on which the names of all students and of their parents could be listed and alphabetized by student last name. (These Lists had, of course, to be prepared early, as they were a necessary part of both group set-up and data collection procedures.) To each of the student names on each alphabetized school List was assigned a serial code number consisting of two digits between 01 and 99. This pair of numbers was termed the <u>Individual</u> Code. It was later punched (along with the appropriate District-Consultant Code) into columns 3 and 4 of all data cards concerning a given student subject

(c) Third, the <u>Coded Master Deck</u> (Format M) was prepared. The District Consultant Code, Individual Code and associated student last and first name, father first name, mother first name and family surname, if different from that of student, were keypunched into IBM cards, one for each student in the sample. A set of six pairs of parentheses were also duplicated onto each card. Finally, a special header

TABLE 4

File Number Scheme for Identifying Punched Card Data

Column #	(1)		(2)	(3) and (4)		(5)			(6)	
	District Code		Consultant Code	Individual Code		Subsample Code			Format Code	
Code	Code	District		Consultant Princiapl School	Student Parent Teacher	Role Group	Sex	Code	Instrument	Code
	0	Los Angeles	0 - 9	00	01 - 5?	Student	M	0	SDS	0

	9	Albuquerque	0 - 9	00	01 - 99	Principal	F	9		

card was prepared for each district, consultant and school and for column designations. The resulting packets of cards were then listed by school, thus producing copies of the <u>Coded Master List</u>. (See Appendix E.)

(d) The Coded Master List was now used to identify forms as they were received and processed. Student and parent names written on forms were matched with the List and the associated code written on each form. The forms themselves were filed in numerical order to await processing. District and school were identified by a distinctive edge mark on the reply envelope (Appendix D) and, as a further check, serial numbers had been printed on the forms and assigned in blocks to the schools.*

(e) The Coded Master List was then annotated to indicate what questionnaire forms had been completed by each parent (and student at the high school level) and which parents had participated in the parent groups. A research staff member matched returned questionnaires and Group Attendance Form entries with names on the List and entered marks in the appropriate pair of parentheses opposite the names.

(f) Next, the <u>Annotated Master Deck</u> was produced by passing the Coded Master Deck through the keypunch in sequence while the operator punched in the marks which had been written by the staff member on the Coded Master List. The resulting Annotated Master Deck was then listed to produce the <u>Annotated Master List</u>. Extra copies of this List were made for Research Center and district use.

(g) Then, the Annotated Master Deck was duplicated. The original was filed for safekeeping and the copy submitted to the sorter. School by school,

---

* Initial experience with this method suggested the need for certain modifications. The printed serial number and edge mark schemes proved effective but cumbersome. Consequently, they were discontinued and instead the school code was pre-marked on the revised SOS form so that it could be automatically punched by the 1230 system. On other forms the school name was stamped before distribution.

(1) a two or four way sort was made, (2) the sorted subdecks listed, (3) code numbers duplicated into columns 1-4 of one or two blank decks, (4) the subsample-Format Code emitted into columns 5 and 6, and (5) the sorted subdecks merged again ready for the next sort. The above five steps were completed for each of the following sorts. The number of decks code-duplicated, the subsample- Format Codes emitted, and the number of subdecks sorted and merged are shown in parentheses (consult Table 5):

(1) Column #1: Separated fathers who completed SOS from those who did not. (2 decks duplicated, codes 21 and 22, 2 subdecks to merge.)

(2) Column #2: Separated mothers who completed SOS from those who did not (2 decks duplicated, codes 31 and 32, 2 subdecks to merge.)

(3) Column #3: Separated boys who completed SOS from girls who completed SOS and from boys and from girls who did not (high school only). (2 decks duplicated, codes 01 or 11 and 02 or 12, 4 subdecks to merge.)

(4) Column #4: Separated fathers who completed FLAI or EVPI from those who did not. (1 (EVPI) or 2 (FLAI) decks duplicated, codes 25 or 23 and 24 respectively, 2 subgroups to merge.)

(5) Column #5: Separated mothers who completed FLAI or EVPI from those who did not. (1(EVPI) or 2 (FLAI) decks duplicated, codes 35 or 33 and 34 respectively, 2 subdecks to merge.)

(6) Column #6: Separated boys who completed EVPI from girls who completed EVPI and from boys and from girls who did not (high school only). (1 deck duplicated, codes 05 or 15, 4 subdecks to merge.)

(7) Column #7: Separated families in which one or both parents participated from families in which no one did. (1 deck duplicated, code 6 2 decks to merge).

        responses combined on one card

2. <u>Procedure for preparation of forms for translation to cards</u>:

(a) Because the special forms used had to be marked properly, it was necessary to check them visually and apply a clean-up procedure where needed before submitting them to the IBM 1230 Optical Page Reader. Marks which were too light or done improperly had to be darkened or corrected by hand. Excessively crumpled forms had to be smoothed.

(b) Group data forms had to be hand transcribed to special <u>Key Punch Forms</u> (Appendices J and K) and checked for errors.

(c) All forms were then serialized and checked against the sorted sub-deck lists made in Step 1 (g).

3. <u>Procedure for translation of data to cards</u>:

(a) Next, the appropriate sets of blank cards into which the code numbers had been duplicated from the subdecks formed after each sort (Step 1 (g) above) were inserted into the feed hopper of an automatic keypunch while the matched questionnaire forms were placed in the feed hopper of an IBM 1230 Optical Page Reader and the information on each form automatically punched into its associated card.

(1) One such deck was designated for each side of the SOS (Formats 1 and 2) for fathers, mothers and, at the high school level, students; a total of four decks at the elementary level and six decks at the high school level. The SOS forms were then fed through the 1230 in proper sequence and the responses punched into the designated pre-punched deck in the same sequence.

(2) One deck was designated for each side of the FLAI (Formats 3 and 4) for fathers and mothers at the elementary school level only, a total of four decks. The FLAI forms were then fed through the 1230 in proper sequence and the responses punched into the designated pre-punched deck in the same sequence.

(3) One deck (Format 5) was designated for the student form of the EVPI and one each for the father and mother respondents to the parent form of the EVPI, a total of three decks at the high school level only. The EVPI forms were then fed through the 1230 in proper sequence and the responses punched into the designated pre-punched deck in the same sequence.

(4) One deck (Format 6) was designated to receive data from the key punch forms summarizing information from three group data devices, the Group Attendance Forms (GAF), Post Series Reaction Sheets (PSRS), and Counselor Reactions to Specific Group (CRSG) forms (Group Data: Parents).

(5) Data from the four school data forms, the General Counselor Reactions forms (GCR), Parent Response Forms (PRF), Community Evaluation Blanks (CEB) and Consultant Application Forms (CAF) were key punched into <u>Master Consultant Cards</u> (Format 7) identified by District-Consultant Code (Group Data: Consultants).

(6) The Student Data Forms, which had been previously filled out and coded by a Project staff member, were so designed that the 1230 would automatically punch the code numbers along with the data. Thus, no prepunched deck was necessary. After all forms were translated the resulting deck (Format 0) was listed and matched with the Annotated Master List. Any missing forms were either prepared and translated or a coded blank card inserted into the gaps in the sequence.

(b) The punched decks were then merged with the coded blank cards produced in Step 1 (g) for which data were not available. Each deck was then listed and compared with the original Annotated Master List. When all lists had been matched, the cards were ready for Step 3 (c).

(c) The completed individual data decks were then submitted to the computer for transgeneration of certain variables, resequencing the computation of scale totals.

(d) All data decks (excluding Format M) were submitted to the collater and the resulting cr_bined deck again listed and checked for error (see Table 6). The completed and checked Finished Data Deck was then ready to be used in subsequent statistical computations. The card addresses of these stored data are found in Table 7.

TABLE 6

SUBSAMPLE-FORMAT CODE NUMBERS FOR DATA CARDS
IN SEQUENCE FOR ANY ONE STUDENT IN THE SAMPLE *

CARD SEQUENCE NUMBER	ELEMENTARY JUNIOR HIGH		HIGH SCHOOL	
	BOY	GIRL	BOY	GIRL
1	00	10	00	10
2	21		01	11
3	22		02	12
4	23		05	15
5	24		21	
6	31		22	
7	32		25

CAF	7							6 7	7 7		

NOTE:

The two digits in each pair represent respectively the subsample code (card column #5) and the format code (card column #6).

Procedural Modifications for the Third Project Year

Experience during this second Project year (Phase One) has indicated the desirability of making certain procedural changes for the year 1965-66 (Phase Two). These changes are primarily in data collection procedure. Some of the data collected during Phase One proved unuseable for one reason or another. The proposed changes are intended to insure the return of a maximum amount of useable data. The proposed modifications are as follows:

(1) Teachers have been permitted to remain anonymous during Phase One. Next year all respondents, whether they are parents, teachers or consultants, will be asked to place their names on all material to be returned for analysis. While there has been some concern expressed that this may affect the kind and frequency of response people will give to the instruments used, the investigators believe that such limitations may be minimized through the utilization of appropriate safeguards. For example, each individual in both parent and teacher groups will be provided with an envelope in which to seal his responses. He will also be assured that his individual responses will not be seen by district personnel and that the Project personnel who process them will not be concerned with the responses of any one individual.

(2) A second change concerns the collection of pre-assessment data from participating parents. Previously, materials have been mailed to all parents, but this resulted in the loss of some data from participating parents. For this reason, it was decided that during Phase Two the first meeting of each parent group will be devoted to data collection. At the elementary and junior high school levels, the initial series, which during Phase One consisted of four sessions, will now contain five sessions. (Invitation letters to parents will reflect this fact.)

The second and third series at these levels will continue to be four sessions long. The length of the initial series at the high school level will remain seven sessions, even though the first session will be utilized in part for data collection.

(3) A fundamental change in data collection procedure is reflected in the fact that mailing of pre-assessment instruments to non-participants will be done by the Research Center. This will necessitate early receipt of Student-Parent Lists (including addresses) from each school. The Student-Parent List will include (a) the last and first name of each pupil in the appropriate grade (1, 7 or the first year of high school) matched with (b) the first name of each of the pupil's parents (and the family surname if different from the child's) and (c) the address of each pupil. This procedural revision will also make it necessary for participating schools to mail returned post cards from parents to the Research Center exactly two weeks after they have been mailed out. Through comparison of the post cards with the Student-Parent List it will be possible to make up a list of parents to whom instruments must be mailed by the Research Center. All mailing of post-assessment materials in May, 1966, will be carried out in the Research Center. Project consultants, however, will continue to be responsible for collecting pre-assessment data from all participating parents and from all teachers and high school students, participating or otherwise. Consultants will also have the responsibility for collecting all-assessment data from teachers and high school students.

CHAPTER V

H Y P O T H E S E S

In a previous publication (Shaw and Tuel, 1964) a number of research objectives were outlined. These were stated in rather general and qualitative terms and it remained to translate them into more specific quantitative and empirical terms in order to create a set of testable hypotheses. As can be readily seen from the last chapter, a wide variety of data ranging from expressions of attitude to ratings of overt behavior was collected and stored on punch cards. The analysis of these data was conducted according to the pattern set by the hypotheses to be described in this chapter.

Kinds of Information Available for Analysis

Considered in detail, the number of variables contained in the data ran into the hundreds. The complexity of this fund of information was multiplied several times when divided along the subsample and consultant dimensions (Fig. 1). In order to reduce this abundance of detail to manageable proportions it was necessary to classify the variable dimension into ten subgroups according to instrument source format and into four categories as to the kind of data involved. (See Table 8:)

1. First were background data, e.g., date of birth, birthplace, education and social and racial composition of community, size and staffing of school and attitude of community towards education.

2. Second were the categories of observable behavior as rated by school staff (e.g., grades and disciplinary attention), assessed by standardized tests (e.g., achievement, intelligence, aptitude and interest), and observed by consultants and participants in group series.
Figure 1. -- Solid statistical matrix showing inter-relationship of variable, subsample and consultant dimensions.

Table 8

Categories of Stored Data

TYPE OF DATA	Subjects Described				
	Student	Parent	Teacher	Coun.	Adm.
1. Background data	0*	0	4	4,9	4
2. Behavior: ratings by school staff	0				
3. Behavior: standardized comparison	0				
4. Behavior: observations by consultants		5,6			
5. Behavior: observations by participants		8		8	
6. Attitudes: self report	1,3	1,2	1	1	1
7. Attitudes: ratings by students		3			
8. Attitudes: ratings by parents	3				
9. General impressions of consultants		7		7	

* Key To Instrument Code

Code	Instrument
0	Student Data Summary (SDS)
1	School Opinion Survey (SOS)
2	Family Life Attitude Inventory (FLAI)
3	Educational-Vocational Plans Inventory (EVPI)
4	Community Evaluation Blank (CEB)
5	Group Attendance Form (GAF)
6	Counselor Reactions to Specific Group (CRSG)
7	General Counselor Reactions (GCR)
8	Post Series Reaction Sheet (PSRS)
9	Consultant Application Form (CAF)

3. Next were attitudes as self-reported by all groups on the SOS and by elementary and junior high school parents on the FLAI, self and parent ratings and parent ratings of student interest, level of aspiration and abilities, and student ratings of how they perceived their parents would rate them.

4. Finally, there were general impressions of the group process as seen by the participating consultants.

These four groupings could be further consolidated into independent variables (background data) and dependent variables (behavior, attitudes and impressions). The latter, of course, only fit the definition of _dependent_ variables when used as criteria of change attributed to the experimental intervention, i.e., parent counseling. Certain other independent and control variables were classified along the "subsample" and "consultant" dimensions.

The _subsample_ dimension contained the five role groups (students, parents, teachers, counselors, and administrators) each of which group was further divided by sex, yielding ten subsample groups (identified by the subsample code number in column 5 of each data card). The entire dimension could also be dichotomized as non-professional (students, parents) and professional (teachers, counselors, administrators).

The _consultant_ dimension contained all participating consultants further classified by school(s) and district in which each served (identified by the District Consultant Code number in columns 1 and 2 of each data card). Within any school a further division was made between participant and nonparticipant parents and between their children.

General Hypotheses

1. Null hypotheses were proposed regarding differences in individual dependent variable means among the two, five and ten divisions of the subsample dimension and

among the two, six and forty-five divisions of the consultant dimension. Null
hypotheses were also advanced regarding differences in any division mean of the
consultant dimension across the subsample dimension and vice versa. Finally, null
hypotheses were set up regarding interactions among divisions of any two or all
three dimensions. When these data are complete, analysis of variance and analysis
of covariance using background data as covariates will be performed.

2. With respect to possible significant intercorrelations between individual
dependent variables, null hypotheses were also proposed. Computation of these
intercorrelations will be performed for the entire sample and for subsample and
consultant dimension divisions when the data are complete.

3. Hypotheses were proposed to the effect that the ten factor scales of the
SOS and the fourteen factor scales of the FLAI as originally extracted with other
samples will be sustained on re-factor analysis. These analyses will be performed
when the data are complete.

4. Null hypotheses were advanced regarding significant correlations between
"background" independent variables and individual dependent variables. The testing
of these hypotheses awaits completion of the data pool.

Specific Hypotheses

1. It was hypothesized that a significant relationship would be found between
individual educational attitudes, expressed as scale totals on the SOS and FLAI, of
(a) fathers, (b) mothers and (c) students (where applicable) and the following data
taken from the SDS (see Fig. 2):

       (1) grade level of student

       (2) relative age of student

       (3) birthplace of student

       (4) family structure of student

Figure 2. -- Tridimensional intercorrelation matrix incorporating background and behavioral independent variables, subsample dimension, and attitudinal scale total dependent variables according to hypotheses 1 and 2.

* The community sample means of asterisked individual variables were compared with the means of other community samples to test hypothesis 2.

(5) occupational level of fathers

(6) occupational level of mothers

(7) size of family

(8) IQ of student

(9) Kuder interest pattern of student

(10) subject marks of student, and

(11) tardies, absences and referrals of student

2. The corollary hypothesis was advanced that a significant relationship would be found between community educational attitudes, expressed as grand mean scale total scores on the SOS and FLAI, of (a) fathers, (b) mothers and (c) students (where applicable) and mean:

(1) transiency (birthplace)

(2) family stability (structure)

(3) occupational level of fathers

(4) occupational level of mothers

(5) size of family

(6) IQ of student sample

(7) overall Kuder interest pattern of student sample

(8) grade point average of student sample, and

(9) tardies, absences and referrals of student sample in an entire district and specific school attendance area (see Fig. 2).

3. It was hypothesized that there would be a significant pattern similarity among the following three sets of Kuder interest patterns for (a) fathers, (b) mothers and (c) students (see Fig. 3):

(1) actual Kuder scores (SDS, Kuder Report Form)

(2) rating of student's occupational interests (EVPI)

(3) rating of student's combined interest and ability (EVPI)

4. It was hypothesized that there would be a significant correlation between ratings of each student's aptitude or subject marks by the following (see Fig. 4):

   (1) his father (EVPI - P)

   (2) his mother (EVPI - P)

   (3) himself   (EVPI - S)

   (4) his teachers   (SDS)

5. It was hypothesized that there would be a significant correlation between ratings of each student's (a) father, (b) mother and (c) student perceptions of his academic potential as perceived by the following persons (see Fig. 5):

   (1) his father (EVPI - P)

   (2) his mother (EVPI - P)

   (3) himself   (EVPI - S)

6. It was hypothesized that there would be a significant correlation between ratings of each student's academic standing in terms of (a) actual ability and (b) teacher marks by the following persons (see Fig. 6):

   (1) his father (EVPI - P)

   (2) his mother (EVPI - P)

   (3) himself   (EVPI - S)

7. It was hypothesized that there would be a significant correlation between ratings of each student's frequency of discussion of vocational plans with his (a) father and (b) mother made by the following persons (see Figure 7):

   (1) his father (EVPI - P)

   (2) his mother (EVPI - P)

   (3) himself   (EVPI - S)

8. It was hypothesized that there would be a significant correlation between ratings of each student's degree of disagreement about vocational plans with his (a) father and (b) mother made by the following persons (see Figure 8):

	Scores or rating by		
	Father	Mother	Student
Actual Kuder scores	FS	MS	SS

(1) his father (EVPI - P)

(2) his mother (EVPI - P)

(3) himself   (EVPI - S)

9. It was hypothesized that the extent of a given parent's participation in the parent groups, favorableness of that parent's rating of the parent groups and favorableness of his consultant's rating of the group(s) in which that parent participated would be correlated significantly with the following variables (see Fig. 9):

(1) Individual educational attitudes (SOS and FLAI scale totals)

(2) Community educational attitudes (community mean SOS and FLAI scale totals)

(3) Individual Kuder interest patterns and ratings

(4) Ratings of student's aptitude or subject marks

(5) Ratings of student's academic potential

(6) Ratings of student's academic standing

(7) Ratings of student's frequency of discussion with parents about vocational plans

(8) Ratings of student's degree of disagreement with parents about vocational plans

(9) Extent of parent's participation in parent groups

(10) Favorableness of parent's rating of his own parent groups

(11) Favorableness of consultant rating of that parent group

10. It was hypothesized that none of the families of variables listed above under hypothesis 9 would exhibit any significant change on post testing following participation in the parent groups both absolutely and using non-participants as controls.

The above listed specific hypotheses do not exhaust the potential store of relationships possible among the numerous variables involved in this study. Only major hypotheses have been spelled out in this chapter.

VARIABLES CORRELATED	Extent of parent participation	Favorableness of parent rating	Favorableness of consultant rating
Individual educational attitudes			
Community educational attitudes			
Individual Kuder patterns and ratings			
Ratings of student's aptitude or marks			
Ratings of student's academic potential			
Ratings of student's academic standing			
Ratings of student's discussion frequency			
Ratings of student's disagreement degree			
Extent of parent participation			
Favorableness of parent's group rating			
Favorableness of consultant's group rating

CHAPTER VI

P R E L I M I N A R Y   F I N D I N G S

The data being reported in this section cannot be considered final, even with respect to the parameters upon which it reports. It is primarily descriptive data relating to the participating districts, schools and consultants. A summary of this data will present a picture of the kinds of school situations in which the Project is being carried out, and of the individuals who are doing the actual work in public schools. In addition, some data is currently available on parent participation in groups. The information presented here represents that which was available at the middle of the 1964-65 academic year.

Participating Districts

After investigating twenty-two school districts in Southern California, six were ultimately selected by Project staff for participation. While one of these districts subsequently withdrew from participation during the first phase of the Project, but will begin as a participant in Phase Two, one of the districts which has participated this year will not be participating next year. The major criteria utilized by the Project staff in selecting districts were (1) evidence of interest and administrative support, and (2) the existence of a cadre of interested and well-trained pupil personnel specialists. It was emphasized at all times by Project staff that pressure should not be brought to bear upon any pupil personnel specialist to participate if his interest or commitments did not incline him to do so.

In addition to the Southern California Districts, the city of Albuquerque, New Mexico, is participating in the Project, making a total of six different school

districts active during 1964-65. These districts range in size from one which repre-
sents a community of 26,000 people to one representing over a million.

Participating Schools

A total of twenty-three schools were participating in the Project at the date
of this report; seventeen elementary schools, four junior high schools, and two high
schools. It is anticipated that this number will increase during the second half of
the 1964-65 academic year. Perusal of data available on elementary schools indicates
that the smallest school was a 14 teacher school serving 400 students, and that the
three largest elementary schools have 33 teachers each, serving approximately 1150
children. The junior high schools were composed of approximately 1100 students each
and were staffed by about 40 teachers. The two high schools had approximately 65
teachers each, serving 1509 and 1700 students respectively. Specific figures for
each school are reported in Table 9.

The children attending these schools were predominantly from middle class
families, but this was a modal figure and some schools showed a striking variation
from it. Five of the elementary schools reported 50% or more of their students as
having come from lower socio-economic status families, while only one elementary
school reported more than half of its clientele as originating in families consider-
ed to be in the upper socio-economic strata. Eleven of the elementary schools re-
ported half or more of their population as having come from middle class homes. For
the three junior high schools on which data were available, middle class families
predominated, but in one school there was an almost equal balance between middle
and lower class families. Complete data are reported in Table 10.

As the socio-economic data suggest, the ethnic distribution among children in
participating schools was preponderantly White Anglo-Saxon. Again, however, it is

necessary to point out that this was a central tendency and that some participating schools were comprised predominantly of non-White Anglo-Saxon students. There were two elementary schools where 50% or more of the population was a minority group, and one junior high school where this situation also obtained. The ethnic composition of the student body of each participating school is reported in Table 11.

The principals of participating schools were asked to estimate the relative favorableness of their constituent population towards schools and education in general. The predominant judgment of the principals in participating schools was in the "good" and "excellent" range. Again, however, there are notable exceptions. One elementary school reported that the attitude of 25% of the parents of children in that school was either "negative" or "poor" towards school and one participating high school reported the same proportion of negative and poor responses. It is interesting to note that in the latter case it was the school with the highest porportion of upper class families in the entire group of schools included in the sample. Eighteen out of the twenty-one schools on which these kinds of data were available indicate that "good" or "excellent" attitudes towards education characterize the parents of 75% or more of their constituent population. Complete data are reported in Table 12.

The schools included in the present sample represented a wide cross-section in terms of size, kinds of populations served, with respect to socio-economic and ethnic status, and attitudes of parents towards education. It should be emphasized that they did not represent all schools included in Phase One of the Project but only those on whom data were available at the time of the writing of this report. This includes the period up to the middle of the 1964 65 academic year.

Participating Consultants

A total of 41 consultants participated in Phase One of the Project. It is
anticipated that approximately 50 consultants will be utilized during Phase Two,
beginning in the Fall, 1965. The range of public school experience among these
forty-o n e individuals was from 0 to 33 years with a median of approximately 10
years. The range of years of experience working in a pupil personnel specialty was
from 0 to 10 years, with a median of three years in this kind of position. These
figures suggest that the participating consultants were a relatively young group
with substantial experience in public school work, but with relatively brief tenure
in the pupil personnel field.

Represented among the 41 consultants are 35 advanced degrees distributed among
29 individuals. Two of these advanced degrees are doctorates, one an Ed.D. in Edu-
cational Psychology, the other a Ph.D. in Educational Psychology. The predominant
degree is the MA in Guidance or Educational Psychology, with a sprinkling of MA's
in Psychology and Administration. There are only a few M.Ed. degrees. The usual
distinction between the MA and the M.Ed. is the completion of a thesis. The heavy
preponderance of MA's over M.Ed.'s in this group suggests the possibility that this
group has a research orientation which might have predisposed them to participate
in the Project.

Almost the entire gammut of pupil personnel specializations is represented in
this group. Those professions represented include counseling, school psychology
and psychometry, school social work, child welfare and attendance, school nursing,
and speech therapy. The most dominant specialization in this group is counseling,
with 27 individuals reporting specialization in this area. Ten are qualified as
School Psychologists or School Psychometrists; 3 as Social Workers; 2 as Child Wel-
fare and Attendance workers; and 1 each as School Nurse and Speech Therapist. (The

total number reported here will add to more than 41 since some individuals are qualified in more than one specialization.) These results are reported in Table 13.

Of particular interest to Project staff was the previous exposure of consultants to both the academic and practical aspects of group counseling. It was noted in the process of talking to various Directors of Personnel Services, Guidance Directors and Assistant Superintendents that in the 22 districts surveyed by Project staff for possible participation, not one reported any systematic small group work with students, teachers or parents. The reasons for this are not clear, but the fact is certainly reflected in statistics available even on this group. Of the total group, 29 out of 41 did have some academic background in group process. This tended to differ radically from one district to another, however. In district A, 90% of participating counselors had academic preparation in group work. In districts C and E, none of the participating counselors had had previous academic preparation. When asked whether they had had practicum experience in addition to theoretical exposure to group process 13, or one third, of the total group said "yes." Two-thirds had had no practicum experience whatsoever. When asked specifically if they had had actual experience in doing small group work with parents, 30 out of 41 indicated that they had had none. Of the remaining 11, seven were classified as having had "some" experience, and four were classified as having had "much" experience in this kind of activity. These figures clearly indicate, even among this select group, relatively little practical background in group process. This situation obviously emphasizes the need for the training workshops conducted by Project staff. Experience clearly indicated that it would have been impossible to find any substantial number of public school personnel with adequate academic and practical background in the kind of professional activity demanded of Project participants. These data are reported in Table 14.

While these data reveal a good deal about the Project consultants, it might be well to attempt to summarize their meaning, and also to add some subjective observations of Project staff members. It has already been remarked that there are some reasons to believe that the data reported here indicate research interests among this group, and that this in turn might have been a factor in their volunteering to participate. Their relative youth might also have been a factor in their participation since Project participation requires the investment of time and effort over and above the usual. More subjectively, Project staff have noted that this was a group of individualists. Most of them were not satisfied with the current status of affairs in pupil personnel services and did not hesitate to say so. They were interested in finding better ways to do things, and beyond that, interested in learning how to promote change within their own systems. Because they were innovative and energetic, they sometimes found it difficult to constrain their group work within the boundaries established by the Research Project. If they thought of a better way to do things than had been delineated by the existing design, some were prone to try it out, occasionally to the detriment of the design. They were very open to new ideas, flexible, and not easily threatened. Of real importance was the fact that they dealt effectively with authority and were not frighten by the representatives of authority. It is the opinion of the investigators that the self-selection of consultants which took place was of much greater importance in obtaining the high quality of individuals represented in this group than were the selective procedures employed by the investigators themselves.

Parent Participation

It should be reemphasized that figures reported in what follows are not complete, but represent conditions as they existed in the middle of 1964-65 academic year. All

parents of first and seventh grade children, as well as the parents of entering high school students, were invited to participate in parent group discussions. The number of parents who signified interest in participating at the first grade level ranged from a low of 12% in one school to a high of 40% in another. In all schools, however, there was an attrition even before the first meeting was held. In the elementary schools this attrition approached 35% of those who had originally signified their intent to participate. Among the participating junior high schools on whom figures are currently being reported the proportion of parents who signified interest in participating ranged from a low of 8% in one school, to a high of 35% in another. It should be pointed out that in the school with the lowest proportion of parent response, there is a high percentage of Mexican-American families of low socio-economic status. Parenthetically, it might be stated here that the counselors were quite enthusiastic about this high and positive response and have indicated they think that they can achieve a still higher proportion in the coming year.

The attrition problem at the junior high school level was considerably more serious than at the elementary school level. In some cases, only one third of the parents who had said they would attend group sessions actually showed up for the first meeting.

Among the participating high schools, the lowest rate of initial intent to participate was 10%; the high was 27%. As was true at both the elementary and junior high school levels, attrition occurred prior to the first group discussion. However, this attrition was around 20% rather than the higher percentages found at both the elementary and junior high school levels. These parent response data are summarized in Table 15.

TABLE 15

	2 "	96	23	13

The existence of this pre-group attrition pointed up the need for a change in procedures. In the following year, changes will be of two general kinds. One will be an attempt to provide for a more personal contact between the group leader and parents prior to the first group session through use of additional mail and telephone contacts. The other will consist of inviting larger parent groups than are actually desired in anticipation that attrition will reduce groups to a more appropriate size.

Attrition approached 50% at the elementary school level <u>during</u> the first four sessions. There was, however, almost no attrition between the first and second series. Figures are not yet available for attrition occurring between the first and second series.

Attrition figures on the junior high school groups are not currently available. At the high school level, there was about 40% attrition <u>during</u> the first series of seven meetings. It should be made clear that attrition was being computed by comparing the number of people who attended the first session of a series with the number of parents who attended the last session. Thus, if 10 parents attended the first session, five parents attended the last session, the attrition rate would be 50%. If attrition were figured on the basis of <u>average</u> attendance at each session, the attrition rate would be considerably lower. Attendance figures are reported in Table 16. Total number of groups formed is reported in Table 17.

Administrator, Consultant and Parent Reaction

Statements in this section should be accepted only on the most tentative basis. Objective data relative to the reactions of the major educational role groups have yet to be analyzed. The statements included here reflect information gleaned subjectively from participating consultants and administrators, and from perusal of a number of parent reactions to the group counseling.

F (Elem)	2	2	3

Self-selection occured not only among consultants but also with respect to those principals who elected to commit their support and their schools to participation in the Project. One major reason for the decision of any administrator not to participate in the Project was that he was already heavily committed to other experimental and innovative programs. Another reason for electing not to participate appeared to be a concern about upsetting the status-quo. The Project Director and Associate Director had many opportunities to talk with principals, some of whom eventually elected to work with the Project, others whom elected not to. It was our observation that general anxiety was a prime factor in the decision of many principals to stay out of the Project. Sometimes this anxiety appeared to focus on a rather generalized fear of developing closer association with parents, at other times it was an anxiety with respect to the competence of guidance workers to do the kind of thing proposed. One Director of Pupil Personnel Services flatly took the position that he would not dare turn his high school counselors loose on parents because they were not competent to do this kind of thing and would create a very bad situation between the school and parents.

The reasons for administrator interest in participating in the Project were also various. There seemed to be two general reasons, however. The first, and least desirable from the point of view of Project staff, was administrator concern about public relations. Such administrators saw this approach to guidance services as a gimmick to improve their relationships with their parent clientele, rather than as a device which would ultimately help children to learn more effectively. The second reason was that some administrators were dissatisfied with current guidance procedures and said, in so many words, that there was a need to try new approaches in order to make guidance practices more effective.

It was easily discernible at the outset that among principals of participating schools there were gross differences with respect to their attitudes toward the parent discussion groups. Those who were somewhat uneasy at the outset appeared to be still uneasy after half a year of experience. The reasons for their uneasiness did not, in the opinion of the investigators, stem from any incidents which had occurred relative to participation in the Project, but rather from their uncertainty as to what was likely to happen as a result of this program. The fact that no negative incidents have occurred in any of the participating schools, and that there has been no negative reaction, either organized or unorganized, toward the parent groups themselves, had apparently not served to lessen their fears. These individuals did not appear to have changed basically in their outlook. It seemed probable, however, that nearly all of them will want to continue their participation in the Project next year.

Among those principals who were not uneasy initially there did appear to have been an attitude shift. Where at the outset they had been mildly approving of the idea, they now appeared to be enthusiastic. In addition, in the larger participating districts there are numbers of administrators who have heard about the Project and who want to be included in it. (Unfortunately, it will not be possible to accommodate most of them.)

Consultant interest in the Project appears to have been generally heightened as a result of their experience with parent groups this year. In not one instance is a consultant dropping out of the Project due to lack of interest. While some consultants will not continue next year, this is due in two cases to the fact that their district is dropping from the Project and, in two other cases, that the consultants are dropping out of the Project for personal reasons.

At the outset, while there must necessarily have been a certain amount of interest for these consultants to volunteer their services, there was at the same time a certain tentativeness as a group. Now, they are much less tentative and seem strongly committed to the basic purposes of the Project. They are generally outspoken in their support of the worth of parent group counseling as they have experienced it this year.

Anything that might be said about reactions of parents must be considered even more tentative than that which has been said about administrative and consultant reaction. Project staff have at least had opportunity for first hand contact with administrators and counselors while with parents this has not been the case. Subjective reaction on the Post-Series Reaction Sheet and verbal consultant reports indicated that parent reaction was generally favorable. As might be articipated, parent reaction ranges all the way from the mildly favorable to the highly enthusiastic. The general impression expressed on most Post-Series Reaction Sheets might be most appropriately characterized as "highly favorable." Parents appreciated the school's efforts in their behalf and felt that it had been a generally worthwhile experience for them. They tended to be less sure whether or not specific attitudinal or behavioral changes had occurred, although there were some cases where parents were able to document what appeared to be rather significant behavior changes in themselves.

Conclusion

These preliminary findings, although primarily actuarial in nature and not complete in any sense of the word, nevertheless provide some cause for optimism relative to the model upon which the study is based. At the outset there was no way of predicting whether parents would even respond to such an invitation since systematic

group counseling with parents had not been carried out by pupil personnel specialists in any district contacted as a part of their normal function. Personnel in participating districts were unable even to estimate the kind of response that would be forthcoming. These results indicate that the approach is feasible both from the point of view of the pupil personnel specialist and the degree of parent participation.

It should be pointed out that the Project is also having other outcomes. One of the larger participating districts is moving already in the direction of building parent discussion groups into their regular personnel program. In addition, at least five other districts in California which are not participating in the program have become aware of the approach being utilized by the Guidance Research Project and these districts have, on their own initiative, undertaken to restructure their pupil personnel programs around the basic principles established in the present Project. While this might be considered a somewhat premature action for these districts to take, it nevertheless gives some indication of the effect that the present Project is already having on on-going guidance programs.

CHAPTER VII

RESEARCH PLANS FOR THE THIRD PROJECT YEAR

The Parent Group Series

Research plans for the third Project year, 1965-66, (actually the second year of data collection) include continuation of the parent group discussion meetings in all participating schools. Slight procedural modifications will be necessary in order to rectify problems discovered during the present year. Chief among these changes will be the fact that all data from parents participating in the group discussions will be collected from them personally _during_ group discussion meetings. The first meeting of the first series at all levels will be utilized for this purpose. This will necessitate adding an extra session to the first series at the elementary and junior high levels. Parents will be informed of the reasons for data collection, and of the fact that the school is interested in finding out whether there is any real merit in carrying out group discussions. While no parent, of course, will be forced to complete data collection procedures as a condition of participation in the group discussions, the fullest possible explanation of the purpose will be to provided to them, the confidentiality of all responses will be stressed and the strongest possible encouragement, short of making completion of the instruments a requirement of group participation, will be employed.

The Teacher Group Series

In addition to the parent discussion groups, all participating schools will also initiate teacher discussion groups. Teacher discussion groups will include two series of five meetings each. The first series of teacher discussion groups will be initiated in the fall, not longer than four weeks after the beginning of the first parent discussion series. The second series of teacher meetings will be

initiated in the spring, within four weeks after the beginning of the second semester. All teacher participation will be voluntary, but it is expected that strong administrative endorsement will be given to such participation. Members of the Project staff will do everything possible to assist consultants in local school districts to obtain such support, including conferences with principals if this is desired by the consultant.

Consultants for Teacher Groups

There will be a relatively small number of consultants who will be participating in the Project for the first time this year. In view of their probable inexperience in group work and their lack of previous contact with the Project, first year consultants will not work with teacher groups unless no other arrangement is administratively possible. In any case in which it is necessary to use a first year consultant to conduct teacher groups, such action will be taken only after direct conference with the Project Director. In order to facilitate discussion, consultants working with teacher groups will not be full time or regular members of the particular school staff where teacher consultation is being carried out, unless no other arrangement is administratively possible. In any case in which such a regular member of the school staff must be utilized to lead teacher groups, specific clearance must be obtained first from the Project Director.

Organizing Teacher Groups

Local school administrators must give permission for Project consultants to meet with their faculties on a <u>minimum</u> of two occasions. The first meeting will occur <u>before</u> parent group discussions are begun. The purpose of this meeting will be to inform faculty about parent group discussions and their general purpose. Every effort will be made by the consultant to assist faculty to understand that the basic

focus of these parent group discussions is to help children learn more effectively in school through attempting to create more favorable attitudes among parents. It should be emphasized by the consultant that parent group discussions are not just for the parents of problem children, but are for all parents. The instruments for evaluating the teacher group series (discussed later in this chapter) will be administered at this meeting.

The second meeting of the consultant with the school faculty should occur two to four weeks after initiation of parent group discussions. The purpose of the second meeting will be to report to the faculty general kinds of information coming out of the parent group discussions that would conceivably be of interest to teaching faculty and to invite teachers to participate in the first teacher group series. Information to be presented might include concerns of the parents about their children's learning, general kinds of parents participating in the group, social or economic factors characteristic of the parent group that have relevance for their children's ability to learn or for motivation of children to learn, etc. In order to accomplish this purpose effectively, it is necessary that consultants who work with teacher groups also carry at least one parent group concurrently.

It will probably be necessary to utilize a substantial part of a faculty meeting for both of the purposes cited above. Strong administrative endorsement of both the parent group discussions and teacher group discussions should be plainly provided. As many additional meetings of the consultant with the faculty may be held as are deemed appropriate by the building principal and the consultant. These two meetings are designated as a minimum.

It is, of course, impossible to predict what the overall proportion of teacher response will be, but it is highly probable that, as was the case with parents, there will be a differential rate of response from different schools. Because it is

impossible to predict the proportion of response, it will be necessary to allow for the contingency that in some schools too few teachers may volunteer to participate to permit the formation of an effective group. If in any given school this situation should arise, the interested teachers should have the opportunity of participating in teacher discussion groups in combination with faculty members from other schools. Arrangements as to time and place are of no consequence to the Project design and will be matters subject to local convenience.

The matter of group size may depend in part on local circumstances, therefore, no rigid attempts will be made to control this. A minimum group size for effectiveness will probably be around eight persons, and a maximum size will be around fifteen. It is assumed that it will be possible to work effectively with smaller teacher groups than was true of parent groups.

The Responsibility of the Teacher Group Leader

Teacher discussion groups will be handled by group leaders in accordance with the same general procedures employed in the parent discussion groups. The meetings will not be didactic, but will provide an opportunity for teachers to discuss with one another basic issues of general concern to them in their professional life. Of course, the group discussion leader will not always be able to completely avoid the didactic role and there may be times when information giving may become a proper part of his counseling function. Information-giving is not, however, his primary function. He is to act as a facilitator of discussion in a non-judgemental atmosphere.

Because most participating teachers will not have had this kind of experience previously, it may be necessary for the consultant to provide some structure, particularly in the early sessions. Such structure should consist of a wide range of

suggestions as to what participants might like to talk about, and of setting the stage for a non-didactic group discussion. The workshop will provide more specific assistance on this particular topic.

Teacher Group Topics

The issue of what might be discussed in teacher group meetings will be of importance in two specific places. The first of these will be in the faculty meeting where teachers are offered the opportunity to participate in such discussions. It is critical that they perceive this opportunity as something of potential value, and not as just another form of "in-service training." The second point at which the question of topics will assume some importance is in the initial teacher group meeting when there will be some concern as to "what this is all about." At both times it should be emphasized that the concern of these group discussions is to provide an opportunity for teachers to sit down with one another and to discuss professional problems which are of importance to them, and not the problems which someone else (such as a college professor or school administrator) think are of importance. The specific mode of operation of groups should be left open, and it is highly probable that a wide variation among different groups will be found. Some may elect to employ a case study approach as a fairly safe way of getting off the ground, while other groups may find it possible to launch rather quickly into full-fledged group discussion of pertinent personal problems related to the teaching function.

It seems best to suggest a wide range of possible topics varying from the relatively "safe" to topics which are more personal in nature and then allow the group to proceed in its own fashion. Examples of possible topics include the following:

1. Evaluating the outcomes of instruction

    (a) It should be made clear that this topic does not relate to any judge-
        ments about teachers for administrative purposes, and that the only
        purpose of embarking upon such a discussion would be to assist teachers
        in more accurately and effectively knowing whether or not they have
        accomplished their own instructional objectives and with what students
        they have succeeded and to what degree.

2. Making effective referrals to guidance staff

3. The classroom environment and its influence on learning

4. Curriculum problems related to student characteristics and needs.

5. Discussion of special behavior problems

    (a) Teachers could be given an opportunity to discuss either specific
        children or specific kinds of behavior problems occuring in their
        classes which interfere with the provision of an adequate learning
        environment. The case study approach might be used either formally
        or informally if this direction is taken.

6. Dealing with specific learning problems

    (a) Teachers might approach the question of how to deal adequately with
        children whose skills in basic tool subjects are inadequate, either
    in terms of providing an adequate learning situation for such students
    whose abilities are limited or in providing remedial help for students
    capable of improving deficient skills.

7. Examination of special social, economic and/or cultural problems existing
   in a particular school population that have significance for teaching.

8. Dealing with problems of student motivation

    (a) The general problem of motivation as it applies to all students

    (b) Academic underachievement

(c) Potential dropouts

(d) Truancy and/or tardiness

9. Discipline and classroom management

   (a) The group may wish to take up either specific problems they have in
   dealing with certain individual children, or may elect to discuss the
   general problem of discipline and its relationship to learning; or
   they may elect to work at both topics more or less simultaneously.

10. Working effectively with parents

   (a) This is an area that many teachers find difficult. They are some-
   times disposed to be defensive with parents, even where such defen-
   siveness is not appropriate to the situation. They may be able to
   gain a great deal from each other and also may be able to examine
   the reasons for their defensiveness, if they incline in this direc-
   tion.

11. Teacher behavior and effective teaching

   (a) Teachers may at some point in the discussions elect to look at their
   own behavior and its relationship to the effectiveness of their
   teaching.

The above topics exhibit a general order beginning with the relatively im-
personal and moving in the direction of dealing with more personal kinds of issues.
It is impossible to predict what will happen in any given group, but it does not
seem inappropriate to assume that, if a normal course of events is followed in the
group discussions, teachers may begin by dealing with relatively impersonal kinds
of topics, eventually approaching more personal issues. It should be pointed out,
however, that the focus in group discussions, even when dealing with such relatively
impersonal issues as the evaluation of classroom instruction, will be upon the

individuals in the group. Complaints about administrative policy, the lack of interest of parents in their children, the poor job done by a preceding school level, or other matters not within the ability of the individuals in the group to change will not be appropriate topics for extended discussion.

The Assessment of Outcomes

To measure outcomes of the teacher group series, it will be necessary to attempt to assess not only children's performance in school, but also the attitudes of participating and non-participating teachers towards guidance in general, towards their experience as group participants, and towards certain educational procedures. In addition, it will be necessary to obtain samples of teacher performance in order to determine whether their participation in groups has had any significant effect on their teaching behavior. The following instruments will be used with all teachers, both participating and non-participating, in schools cooperating with the Project:

1. The School Opinion Survey (Form C)

2. Educator's Professional Inventory

    (a) This scale includes questions attempting to get at teacher grading practices, teacher attitudes toward guidance, and self-ratings with respect to various teacher functions.

Teachers in each participating school will be asked in addition to complete either the Minnesota Teacher Attitude Inventory (MTAI), or a a standardized case study.

Evidence of changes in certain teacher behavior available in records will be utilized, including rate of referral of students to guidance and other specialized personnel, kinds of referrals made, and changes in grade point average from the first to the last marking period during the 1965-66 academic year. In addition, supervisor ratings will be utilized where possible.

All instruments will be completed by teachers in participating schools prior to the beginning of the teacher group series in the fall, and following the completion of the teacher group series in the spring. It should be emphasized that responses are required from all teachers in participating schools, participants and non-participants alike. Every attempt will be made to guard the confidentiality of individual teachers' responses. Data will be collected during a faculty meeting. Each teacher will be provided with an envelope in which to seal his responses. These sealed envelopes will then be returned directly to the consultant (or, if preferable, to one of the teachers themselves), before the end of that particular meeting, who will immediately transmit them, unopened, to the Research Center so that no data can become lost. It will be necessary for teachers to place their names on all forms, but they should be assured that no one in the district, including the consultant, will know what the responses of a specific individual teacher have been. They can also be assured that their individual responses will be of no interest to members of the Research Center who will process the data. With these assurances and with strong administrative endorsement and support, it is hoped that there will be no hinderance to appropriate and consistent teacher cooperation with the total research effort.

A P P E N D I X   "A"

TOTAL PROJECT SCHEDULE

TOTAL PROJECT SCHEDULE

1. <u>First Project Year</u> (September, 1963 - August, 1964)

   The first year of the Project was devoted to Project planning and personnel training, according to the below listed phases:

   A. Hiring staff (September, 1963)

   B. Perfecting design, developing instruments, contacting and selecting school personnel (October, 1963 - August, 1964)

   C. Workshops (June, 1964 - August, 1964)

2. <u>Second Project Year</u> (September, 1964 - August, 1965)

   The second Project year (actually the first year of experimental work in the schools) was conducted in the following phases:

   A. Preliminary consultation with participants (September, 1964)

   B. Initial pre-data collection (October,- December, 1964)

   C. Parent group series (October, 1964 - May, 1965)

   D. First post-data collection (May - June, 1965)

   E. Data analysis and writing (June - August, 1965)

   F. Workshops (April - May, 1965)

3. <u>Third Project Year</u> (September, 1965 - August, 1966)

   The third Project year (second year of experimental work in the schools) will carry out these phases:

   A. Preliminary consultation with participants (September, 1965)

   B. Initial pre-data collection for new samples (October - December, 1965)

   C. Parent group series (October, 1965 - May, 1966)

   D. Teacher group series (October, 1965 - May, 1966)

APPENDIX "A" (Continued...)

  E.   Second post-data collection (May, 1966)

  F.   Data analysis and writing (June - August, 1966)

4.   <u>Fourth Project Year</u> (September, 1966 - October, 1967)

  The fourth Project year will begin with the third year of actual work

  the schools, and conclude with the final data analysis and report

  writing. Only <u>limited</u> work in schools will take place during this

  year. The following phases are foreseen:

  A.   Data analysis and writing (September, 1966 - October, 1967)

  B.   Environmental studies, utilizing <u>School Opinion Survey</u> (September, 1966 -

    October, 1967)

PARTICIPANT APPLICATION FORMS

(1) School Application For Participation
     in the UCLA Guidance Research Project

(2) Individual Pupil Personnel Specialist Application
     For Participation in UCLA Guidance Research Project

SCHOOL APPLICATION FOR PARTICIPATION IN THE
UCLA GUIDANCE RESEARCH PROJECT

(To Be Completed by Head Counselor)

1. Name of person completing this form_____

2. School_____ 3. District_____

4. Has appropriate administrative approval been obtained for participation in the project?_____

5. Number of full-time pupil personnel specialists on staff?_____

6. Number of part-time pupil personnel specialists on staff?_____

7. Total number of full-time equivalent counseling positions?_____

8. Pupil-counselor ratio in your school?_____

   (Computed on basis full-time equivalent counseling positions)

9. Estimated size of entering class, Fall, 1964?_____

10. Number of teachers on your staff?_____

11. Number of pupil personnel specialists who desire to participate in project?

   _____. Have all of these counselors completed application forms?_____

12. Please give the percent of time spent by your total staff during the regular school year on the following activities. If you do not have factual information, please give the best approximation you can. The total should add to 100%.

12. Direct contact with students	_____
13. Direct contact with teachers	_____
14. Direct contact with parents	_____
15. Administrative and clerical	_____
16. Testing activities (Not including interpretation)	_____
17. Programming (Not including contact aspects)	_____
18. Other (please specify)	_____

Form S 100

19. Has your staff engaged in group work with students?_____

20. Has your staff engaged in group work with teachers?_____

21. Has your staff engaged in group work with parents?_____

22. If the answer to one or more of the above (19, 20 or 21) was "yes", please outline details below.

23. What is the attitude of your faculty toward the pupil personnel services program? Please describe in your own terms.

24. Will it be possible to make the proposed parent counseling a part of the regular load of participating counselors for the next year (that is, to lighten their load in other areas of work)?_____

25. Would you anticipate serious negative reactions to the parent discussion
    groups from parents or pressure groups?_____

    If yes, please explain.

EXPLORING THE EDUCATIONAL ENVIRONMENT

An Address Delivered to the 91st Annual Forum
of the National Conference on Social Welfare

By
John K. Tuel, Ph.D.

Associate Director and Research Coordinator
IRCOPPS Regional Research Center
University of California, Los Angeles

The last century has witnessed profound changes in the philosophy and techniques of education. The movements from an agricultural to an industrial society, from rural to urban population balance, from marked isolationism to pronounced international involvement, together with their correlative trends, have acted to remold public education in many respects. Changing philosophies of higher education have tended to percolate down to secondary and elementary schools with consequent modification of their objectives and techniques. The public school has found itself increasingly responsible for important child training functions once performed by the home; the school having been awarded these roles, as it were, by default on the part of the home and community. During this same period, the public school has had to face the growing challenge of providing education for all, instead of only for those who could meet strict requirements or who were interested in an education beyond the eighth grade. The American school could not be content with the European pattern of "education for the qualified." The school found it necessary to take pupils, qualified or not, and to try to give them the kind of education modern society demanded.

With such far reaching changes has come an immensely increasing complexity of what may be termed "educational environment." No longer is the child's academic educational environment bounded by the four walls of the one-room

school house, where one versatile woman performed as best she could the functions of teacher, counselor, principal, nurse, social worker, and custodian. No longer is his peer group much like his large family at home or his parents or neighbors likely to be members of the school board. The impersonality, rapid pace, and competitive values of modern society have changed the scene completely.

What have been the effects of these radical developments? What changes have occurred in the attitudes of parents toward education and the school? What are the characteristics of the general educational environment in typical schools today? What implications has the concept of "educational environment" for modern guidance programs? What is the impact of this environment on such perennial school problems as drop-outs, underachievement, chronic disciplinary cases, truancy, tardiness, and teacher dissatisfaction - to mention but a few.

A review of recent literature reveals a surprising dearth of well conceived and executed research on the general educational environment. Here and there are studies of a specific aspect of it, or of special groups of exceptional children within it. But, comprehensive investigations are conspicuous by their absence. An important research vacuum clearly exists.

As is so frequently the case in research, a paucity of sound and meaningful investigations is symptomatic of a deficiency or complete lack of an adequate theoretical model which can define the field of interest, generate testable hypotheses, standardize special terminology, and relate concepts to one another and to those of other disciplines as well.

Having indicated the difficulty of the task, it is with some trepidation that I here attempt to outline a general model for the study of the educational environment. It would seem appropriate to begin with a suggested definition:

The educational environment, or "climate of learning," may be defined as that part of the total objective environment which more or less directly influences a student's academic learning. (Were that part included which indirectly influences learning, very little, if any, of the total affective environment could be excluded.) This educational environment may be visually expressed through the spatial construct of several concentric spheres of influence impinging upon the individual student. With each widening sphere, the influence exerted on the individual learner tends to be increasingly diffuse; but, on the other hand, this influence extends to a greater and greater proportion of the population. Thus, while the primary level affects only one person directly, the ultimate level influences all.

The primary sphere of the educational environment is, of course, the "self" or "intrapersonal environment." This central sphere is composed of the individual philosophy of life, personal values, life goals or objectives, characteristic social techniques, and behavior patterns for dealing with life situations. Enmeshed with these are the individual's self-regarding attitudes or "self-concept" and his weltanschauung or world concept. The self is, of course, to some ways of thinking, not an aspect of the "environment" at all. It is the special sphere of the clinical, idiographic, case study approach to human behavior.

At the core of the outer environment, especially from a developmental point of view, is the home. This sphere is mediated primarily by the parents and secondarily by whatever siblings may share the home with the subject. The importance of the home as a part of the educational environment, although given varying degrees of lip-service by educators, has largely been overlooked in practice. For a number of educators, parents and the home have been seen only as obstacles to the aims of education and scapegoats for its failures.

Traditionally, the school has been able to do little about the home conditions of its charges, although these home conditions and attitudes have long been recognized to exert a powerful, probably the most powerful, influence on the child's school learning. Thus, the school's chief effort toward improving the home aspects of the educational environment has often been to train the next generation of parents in the fond hope, often disappointed, that they would bring about the needed improvements when they themselves eventually established their own homes. Some schools, however, not willing to wait a generation for a "bird in the bush," have instituted parent education programs, attempted to vitalize the PTA, or worked through social service agencies toward home educational environment improvement. Yet, unfortunately, many school people persist in harboring a rather distorted conception of most parents' real attitudes toward education. In summary, the possibilities for more extended interaction between the home and school still represent a vast, unexplored wilderness, inviting the intrepid (we hope not foolhardy) researcher.

The third sphere in our model, and the ultimate focus of the educational environment to the layman, is the _classroom_. This sphere is mediated primarily by the teacher and secondarily by the classmates of the subject. The parallels between home and the classroom are easily seen. The differences are often overlooked. It is here, in the classroom, that the bulk of previous educational research has been conducted. This is with good reason. The classroom is obviously the major center of school learning and it is the classroom teacher and classroom peers who in the early grades exert a powerful influence on budding attitudes and work habits. Research in this area has tended to focus on techniques, rather than on attitudes, values, objectives, and areas of tension, which, though more illusive, are nonetheless major determinants of the educational environment.

Supraordinal to the classroom lies the sphere of the _school_ as a whole, mediated by the principal and his staff, on the one hand, and the student body on the other. The degree of integrity of the school, of course, varies considerably from school to school, some schools having a high degree of esprit de corps and organizational identity, and some being fragmented into several more or less competing camps. The strong identity of the former and even the relative lack of identity of the latter type of school clearly contribute their infl nce to the general educational environment. Thus, it is clear that the school as a whole, apart from the classroom, exerts its own influence upon the educational environment. It would seem logical to believe that the proportionate influence of this school-wide gestalt should increase at the secondary level, with a decrease in the force of the individual classroom. Such a shift of power should widen the role in the educational lives of individual students of the school-wide officers (e.g., principal, vice principals, deans, counselors) and the faculty as a whole, at the expense of the individual classroom teacher (and perhaps to the detriment of the subject matter and marks with which the individual teacher remains identified). The influence of a wider group of peers and of the extra-curriculum also becomes prominent at this secondary level. Furthermore, especially in grades eleven and twelve, the influence of out-of-school peers (e.g., drop-outs) may become a significant vector in the educational environment cf many students.

Except in very small districts, the school is only a segment cf the total educational environment encompassed by the _district_. Districts differ widely among themselves with respect to such factors as the wealth, status, and stability of their associated communities, the educational sophistication of their governing boards, their administrative authority structures, and

the strength of their chief administrators. Although the influence of these district-wide factors on the educational environment of the individual student may seem remote, it may often be pervasive yet subtle and difficult to assess. This complexity has probably often discouraged investigation and, consequently, a real research need continues to exist at the district level.

Beyond the district may be found the region, a sphere more difficult to define since few, if any, distinct boundaries exist. Yet, unclear as regional boundaries may be, the characteristic attitudinal distinctions among regions, such as the South, New England, and the West, are matters of common knowledge. Regional differences in education have been given considerable publicity in recent years, especially since they are inextricably bound up with arguments pro and con federal aid to education and other political issues. Such differences in educational environment and their effects upon school learning would seem worthy of intensive study. It is apparent that a significant research vacuum exists in this area.

It might seem unnecessary to some to extend the environment model to the national level. However, the influence of the overall national sphere of the educational environment, especially from a comparitive point of view should definitely not be overlooked. No informed person would deny that profound differences in educational philosophy and objectives exist between the United States and other nations. The unique character of American education is widely recognized. Yet, the specific effects of this national sphere of the educational environment remain to be fully described.

The ultimate and all embracing level of the educational environment model is the sphere of our contemporary world. In describing the world environment we must seek some index of comparison, and, lacking any contemporary

sister world, our only recourse is historical analysis. The general educational affects of living at this time in human history, as compared to other eras, should not be ignored in any comprehensive study of the educational environment.

The model of the educational environment outlined thus far would be insufficiently precise were we to content ourselves with a delineation of the levels or "scope dimension" alone. It is necessary to add a second important dimension to the model. This dimension extends from the idea plane to the behavioral plane and might thus be called the "materialization dimension."

At the idea pole we find the plane of philosophy. This may represent an individual philosophy of life, however embryonic, a philosophy characteristic of a certain home, or a seasoned national philosphy. To the measure of its maturity, such a philosphy relates the various aspects of life to a reasoned whole. It posits certain assumptions about the ground of being, the nature and destiny of man, the nature of truth and how it may be known. Profound differences of opinion regarding these matters may be found from individual to individual and from nation to nation. If the results of preliminary research by this investigator may be credited, the philosophical signatures of most individuals may be found to fall within one of three or four broad schools of thought. However, varying degrees of inconsistency may also be found within individuals and nations with respect to their philosophical assumptions. The effects of philosophy on the educational environment remain a vast and, to many, a forbidding wilderness beckoning the intrepid explorer.

One step removed from philosophy along the materialization dimension is the plane of values. Values reflect the underlying philosophy of the individual, home, school, or nation, and are often confused with it. What are the

basic assumptions about values, about what is important? In a hierarchy of values, what should be given first, second, third place? Preliminary investigation suggests that many teachers have only a very foggy notion of what is important, and that there is very little congruence between the values that they profess and the educational objectives, stated techniques and actual behavior which are supposed to stem from these values. There is good reason to hypothesize that values expressed by significant persons will when investigated fall into certain definite philosophical categories, and that marked discrepancies among values, objectives, techniques and actual behavior (as well as among significant persons on these dimensions) will be found. It is further hypothesized that degree of non-congruence will be associated with certain criterion factors.

Closely related to values are objectives. When the focus is on education, objectives answer the question "What should be the goals of education?" Such answers, presumably, should be derived from values, i.e., "What is important?" In practice, however, considerable discrepancy may be expected between the objectives and values of the same person. Such discrepancies and non-congruence of objectives among significant persons in educational roles may prove to have important implications for the educational environment. What preliminary investigation I have conducted indicates little agreement among school personnel about educational objectives. All too often educationists are themselves too hazy about such objectives for comparison to be made.

The means employed to attain educational objectives are termed "techniques." A study of this aspect of the educational environment asks the question "What should be the techniques used to realize the goals of education?" Educational techniques embrace such areas as motivation, methods of

presenting material to be learned, classroom management and discipline, and
evaluation. Techniques are essentially the expert professional methodology
<u>endorsed</u> by the trained teacher. They also include, however, the procedures
<u>endorsed</u> by other school personnel and even by the student and his parents,
who are usually regarded as the objects of such techniques. Please note that
I specify "endorsed", for there may be vast discrepancies between the tech-
niques a person will endorse and those he will actually employ or submit to
in a real situation.

This brings us to the behavioral'pole of the materialization dimension.
Here we have the actual behavior of the parent in the home, the student and
teacher in the classroom, the school and district level administrators, and
the community voting on a school issue. It is not only politicians who
<u>endorse</u> one thing and do another! If we are to get a complete picture of
the educational environment, we cannot depend solely on what people <u>say</u> they
value, seek, and do, but on observations of their actual behavior. On the
other hand, mere observation of human behavior is, to my way of thinking,
also insufficient. I believe that to obtain a comprehensive picture of the
learning environment we need to examine all five planes of the materialization
dimension: philosophy, values, objectives, techniques, and actual behavior.
I further believe that these must be studied, where appropriate, at each
level of the scope dimension. Only so can the complex structure of the
learning environment ultimately be unveiled.

Thus, I have sketched for you a model for the study of the learning
environment. But it is not enough to propose a model. That can be the easy
part. A model can remain only a pleasnatly proportioned idea unless someone
builds a research design on it. It is just this that my colleagues and I at
the IRCOPPS Regional Research Center at UCLA are attempting to do. Without
taking too much more time I would like to tell you about it.

To measure the attitudinal planes (philosphy, values, objectives, techniques) we have developed a special instrument, The School Opinion Survey, which may be administered to samples of significant persons (parents, students, teachers, counselors, administrators) in school populations across the country. When this instrument has been administered to an adequate sample of such persons, the result will be factor-analyzed. It is hypothesized that certain factors representing important educational dimensions will be extracted. Intercorrelations among the various planes and levels on the two major dimensions will then be compared with behavioral descriptions obtained by direct observation, and records of behavior (e.g., grades, test data, attendance records, etc.). By such procedure we hope to determine what configurations of the idea planes are correlated with certain patterns of the behavioral plane (e.g., low grades, truancy, high achievement test scores, etc.). Also, we hope to learn what are the behavioral correlates of relative individuals having interacting roles in a learning situation, and among groups at various levels of the scope dimension. All in all, we have carved out for ourselves a mammoth task. But if we are engulfed by it all, we trust that in the not too distant future you will see some of our findings in print.

THE USE OF GROUP PROCEDURES IN SCHOOLS

U.C.L.A. Guidance Research Project
(Compiled by: Rosemary Wursten)

Group procedures are being viewed more and more favorably as the pressures

of counseling needs mount and as more is learned about the group process. The

possibilities in group procedures for schools are great. Pupil personnel

specialists such as Lifton (1961) are coming to recognize that group skills

are essential for maximum effectiveness in the school setting. Lifton advocates

that counselors work in groups with pupils, parents, and teachers as well. This

paper summarizes the recent literature on group procedures with these three

groups.

I. Group Procedures With Students

A. Group Counseling

The major portion of the literature dealing with group procedures in the

schools focuses on group counseling with students. Articles on group counseling

typically discuss this procedure in terms of prevention, remediation, or process.

In the past, counseling has been most concerned with remediation of

problems but, while this emphasis is still prevalent, group procedures in schools

are increasingly preventive in nature, seeking to prevent problems from growing

beyond the point where the individual requires special help to deal adequately

with them. Such procedures attempt to help students anticipate difficulties,

particularly at articulation points, and to prepare them to deal with such prob-

lems in an effective manner.

Studies on group counseling for the remediation of problems have focused

on improvement of academic achievement, interpersonal relations, and self-under-

standing. Group counseling of academic under-achievers attempts to resolve

problems which interfere with the student's academic performance with respect

to either his ability to acquire knowledge and skills, or to utilize such knowl-

edge effectively. Baymur and Patterson (1960) found that underachieving high

school students who received a series of individual or group counseling sessions, or a single motivational counseling session showed an increase in Q-sort adjustment score and grade average which was significantly greater than that of controls. Broedel (1959) compared the effects of group counseling with no counseling for underachieving gifted adolescents and found a significant difference between the two groups only with respect to "increase in self-acceptance." Broedel, et. al. (1960) counseled four groups of underachieving ninth graders. Three of the four groups showed significant growth in achievement test scores, increased acceptance of self and others, and improved ability to relate to peers, siblings, and parents. Fisher (1953) found that group therapy with retarded readers produced significantly more progress in reading than no therapy. Jensen (1958) held small group counseling sessions for primary school underachievers and found that the participants showed improvement in achievement and ability to do independent classroom work. Ney (1958) reported that multiple counseling for under-achieving sixth graders gave participants a feeling of having something to contribute when they shared group decisions with their classes. Participants also seemed more "settled" in their class work on meeting days.

Group counseling of students with problems in interpersonal relations attempts to deal constructively with these problems in order to increase learning effectiveness. Brach (1958) reported that group counseling in a permissive atmosphere using Adlerian techniques resulted in improved behavior of seventh grade boys in class and discussions. An anonymous report (1958) stated that group counseling with nonconforming ninth grade boys produced improvements in attitudes, attendance. and effort made in school during the semester following that in which they were counseled. Caplan (1957) worked with seventeen junior high school boys exhibiting conflict problems with school authorities. Individual counseling was available to boys requesting it. Post-counseling measures showed that the boys counseled in groups had

high correlations between self and ideal self and had significantly improved

citizenship marks over controls. Grades were not affected by the treatment.

Cohen (1956) reported that group counseling of delinquent boys in a residential

setting helped the boys to understand that the school machinery works the same

for all. Boys also showed improved social relations and better group partici-

pation. Crawford (1958) established a group emphasizing rehabilitation rather

than punishment for school "law-breakers." Group members participated in free

discussion in meetings held during assembly periods until they felt that they

"deserved" to be released from the group. Davis (1959) studies the effects of

group guidance and individual counseling. Subjects counseled individually re-

ceived two hours each while those receiving group guidance had twenty meetings.

Kelly (1958) used a semantic approach to group counseling with five high school

students whose drag racing was a community problem. Discussion of certain key

words was successful in reducing hostility and resentment toward authority.

Drag racing also ceased to be a problem. Mann and Mann (1959) found that role

playing significantly increases in interpersonal adjustment on the criteria of

"desirability as a friend," "aiding in the attainment of group goals," and

"cooperativeness." Stocky (1951) compared the effects of group counseling, in-

dividual counseling, and employment on adolescent boys with adjustment problems

and found that boys of the counseled groups showed significant improvement in

adjustment, but neither the employed, nor the control group did.

Group counseling has also been employed to bring about increases in

self-understanding which enables subjects to view their problems more construc-

tively and cope with them more effectively. Bryan and Younker (1958) counseled

six pre-delinquent girls and held one group parent conference and a total of

twenty conferences with individual parents. Evaluation of the project indicated

increased competence in ability to cope with problems. Robinson (1953) reported

that a group therapy project for senior high school girls helped participants

evaluate their personalities in a more objective way and helped them under-
stand that other people feel much the same way as they do. Standing (1958)
used "creative drama" as a group counseling technique for senior high school
students with emotional problems and a need for success experiences. Indi-
vidual counseling was given with the group work. Improved life-adjustment
patterns resulted and remained stable for five years after treatment. Falick,
et. al. (1955) studies the effects of a club used as a therapeutic technique
in a school-based mental hygiene program. They found that no therapeutic gains
were made and that the club's permissive atmosphere carried over to the class-
room and became so destructive that the club had to be abandoned.

Group procedures as preventive techniques are relatively new. Many
of the studies that have been done have concentrated on facilitating transition
from grade school to junior high or from senior high to college or employment.
Cuony (1955) held group meetings with high school seniors to discuss common
problems connected with going to college. Individual counseling was also
available to these students. Participants reportedly found these meetings
helpful. Brewer (1958) found that group discussions of homeroom-selected
topics led junior high school students to the awareness that other students
have similar problems. Froehlich (1958) contrasted group counseling with
individual counseling, using increase in accuracy of self-ratings as the
criterion. Forty-two high school seniors served as subjects. In two of
three statistical comparisons made, multiple counseling produced significant
increases where individual counseling did not. Gingrich (1957) reports that
in Mamaroneck, N.Y. every 4th 5th, and 6th grade pupil meets in small groups
with the principal to discuss problems important to all children at these
ages. Driver (1958) advocates a preventive or early treatment program for
emotionally disturbed or maladjusted pupils through a combination of parent,
teacher, and pupil work and gives an example of a successful group guidance

project. Bennett (1963) stated that the purposes of group guidance should be to: 1. "Provide opportunities for learning essential for self-direction with respect to educational, vocational, and personal-social aspects of life.." 2. "To provide opportunity for the therapeutic effects of group procedures through perspectives gained from study of common problems.." 3. "To achieve guidance goals more effectively and more economically.." 4. "To implement individual counseling and render it more effective.."

Group procedures are also discussed in terms of process. Miller and Biggs (1958) established groups on the basis of sociometric data to form three friendship and three neutral groups for undirected group discussion. Attitudes changed in both the friendship and neutral groups after group discussion, but there were no significant differences between the friendship and the neutral groups. Wigell and Ohlsen (1962) studied the content of tape recordings of group therapy and found that initially group participants talked more about authority figures, doing things, and sex; and during the final sessions more about peers, group members, self, and family. Bonney and Foley (1963) analyzed the transition stage in group counseling in terms of congruence theory and stated that in order for congruence to be established the counselor must communicate to the client that his problems can and should be discussed in the therapeutic atmosphere of the group even though it may be inappropriate to do so outside the group. Eiserer (1956) stated that the group situation itself has certain unique values. It serves as a reality testing ground, group members are able to help each other, interpersonal skills are developed, and the basis for social reintegration is present in the perception of sharing common problems. Goldman (1962) analyzes group procedures in terms of type of content (academic, school related, or non-school) and three process levels (teacher planned topics to group planned topics). He is of the opinion that guidance should differ from instruction in process as well as in content, but that teachers have difficulty

in making the transition from teacher-led to group-led discussion. Rinn (1961)
makes a similar distinction and agrees that there is a basic incompatibility
between the two approaches which lies both in the leader's formal position
and in the group's expectations. Wright (1959) discusses multiple counseling
as simultaneous connseling with several individuals as opposed to group guidance.
Multiple counseling is characterized by a common problem held by group members
who perceived and identify with this common element.

B. Classroom Group Procedures

Croup procedures in the classroom have been analyzed both in terms of
outcomes and in terms of methods used. The greater part of the research in
this area is concerned with outcomes. Kobliner (1959) examined the effects of
a pre-entrance orientation course on the adjustment of sixth grade pupils to
junior high school and concluded that the course failed to affect significantly
the behavior of the experimental subjects. Reber (1960) reports that the use
of radio broadcasts and tape recorded programs has improved the classroom
guidance program, giving guidance workers more time for individual instruction
and other tasks. Students are reportedly making better educational plans, are
better adjusted, more confident and secure, and making better use of their
time. Wease, et. al. (1963) report that student and faculty response has been
favorable to 15-minute guidance programs on educational and occupational infor-
mation and eighth grade orientation televised during homeroom periods over
closed-circuit television.

A wide variety of classroom group procedures have been discussed in the
literature. Davis (1958) used puppet plays and group discussion to modify
certain behavior reactions in kindergartners. The puppet first enacted un-
acceptable behavior, then children and teacher discussed better ways of be-
having in that situation. The puppet then enacted the better behavior. (See
also Borow, 1958). The Association for Supervision and Curriculum Development

(1955) presented the viewpoint that guidance should be effectively integrated with classroom teaching since all children face a variety of adjustment problems in the normal course of growing up and need guidance in the resolution of their problems. Josephs (1954) suggests that guidance be the work of the teacher as it can readily be integrated with subject matter such as English where biographies are studied. Koile (1955) believes that the "regular instructional program" can and should mature into a more flexible and meaningful process for offering learning experiences to students in groups. He is of the opinion that group guidance at present operates on the "fringe" of the "major design for learning." Radner (1956) also believes that guidance could logically be a part of the English class through a special unit on problem solving. McCabe (1958) suggests that the teacher is more important as a guidance worker than counselors who have only sporadic contact with children. The teacher should maintain a helping relationship with pupils and should not allow their personal problems to interfere with their effectiveness as teachers. Searles (1959) suggests that guidance be part of a required four week summer session course. This would have the advantage of separating social sciences from personal adjustment. Riccio (1958) is of the opinion that guidance should be limited to non-academic problems. He further believes that the goals of guidance and the core concept are the same and that mutual cooperation should be elicited.

C. Vocational Guidance

Group procedures in the vocational area have centered on career days and courses on occupations. Cuony and Hoppock (1954) taught a course in job finding and job orientation to a group of 35 non-college preparatory students who were high school seniors. One year after graduation the experimental group was higher on job satisfaction, earnings, and number of weeks employed than a control group which did not take the course. Cuony and Hoppock (1957) found that the initial gains shown in the experimental group held constant over a

5-year period. Gribbons (1960) in evaluating an eighth grade group guidance program using You: Today and Tomorrow found that the program produced significant gains in helping students appraise their abilities, interests, values, knowledge of educational and occupational opportunities, and integrate, interpret, and use data about self, education, and occupation. Harlow (1956)[a] conducted a two-session vocational guidance project for students interested in summer employment. Two hundred of the 554 applicants obtained employment through the agency or on their own. Harlow (1956)[b] reported on a group guidance project centering on "career nights" sponsored by the Jewish Vocational Service and the Eric Neighborhood House. Kutner (1958) evaluated occupational field trips in terms of vocational success and found that the group given field trips did not differ significantly from controls. Lowenstein and Hoppock (1955) studied the effects of an occupational course on adjustment to college and found that the participants in the course made a better adjustment to college, received higher grades, spent less time studying, spent more time on extra-curricular activities, and had more frequently made an occupational choice by the end of their freshman year. Roskens (1958) examined the effectiveness of career days and found that 56.5% of those reporting thought that career day was "not at all worthwhile" due to poor planning and preparation of students. Rusalem and Darer (1960) found that slow learners receiving classroom guidance discussions, group vocational counseling, individual counseling, parent counseling, and consultation with teachers showed greater realism and maturity in vocational planning and an increased freedom from parental domination in making choices. Participants also had a better understanding of work responsibilities. Sinick and Hoppock (1960) in a survey of states teaching occupations found that most states had schools giving occupations courses, career days, units on occupations, and maintaining occupational information files. Rubenfeld (1954) held weekly group conferences on careers which were announced in advance and attended only by those interested. Students had good questions

to ask and participated more in conferences advertised through the relevant subject classrooms than those advertised in homerooms.

D. Special Techniques

Denny (1959) found that certain selected motion pictures were effective in reducing frustration and increasing personal adjustment. Greater success was achieved with better adjusted subjects, girls being better adjusted than boys, and high I.Q. subjects better adjusted than low I.Q. subjects. Geiger (1958) reported on the guidance functions that student activities perform in the elementary school. Students participating in student activities had an opportunity to demonstrate that they could accept responsibility and could govern themselves in a democratic fashion. Harris (1955) reported that "educational forums," "parent forums" (3 or 4 outside speakers), and career days were used as effective guidance techniques in one parochial preparatory school. Strang (1960) reviewed a number of group procedures that can be used effectively in the schools such as films, discussion of problems through the study of literature, multiple counseling, and others. Tarbet (1954) discussed guidance possibilities with television and gave a brief review of such programs not in effect.

II. Group Procedures With Parents

Schools have only recently attempted to elicit parental understanding and cooperation through meetings of pupil personnel specialists with small groups of parents. The success achieved thus far indicates an area meriting further investigation. Keppera and Caplan (1962) did group counseling with academically underachieving tenth grade boys and/or parents. Their findings showed that the boys whose parents were counseled but who did not themselves receive counseling showed a significant increase on congruence of self-ideal Q-sorts. Buchmueller, et. al. (1954) instituted a group therapy project with parents of behavior problem children in public schools. Their most typical findings was parental

rejection of children accompanied by over-protection and over-indulgence. The group sessions brought about release of guilt in mothers participating. About 80% of the children whose mothers participated showed improvement. (See also Parle, 1954.) Russell (1959) studied the effects of group therapy for mothers on reading disability of their sons and found that boys whose mothers received group counseling made significant gains in reading over those who received only remedial reading instruction. Samuels (1958) found that mothers counseled in groups in a 5-week summer project became significantly less authoritarian, but that their sons did not show any progress with their reading disabilities, perhaps because of the short period of the experiment. Shatter (1957) investigated the effectiveness of a group therapy program including the child and his mother for the remediation of reading difficulties and found that subjects also made more growth in maturity, self-esteem, and independence. Tamminen (1957) evaluated attitude changes in parents toward parent-child relationships as a result of a televised program of parent panel discussions. The results indicated that parents who watched the program showed an increase in rating significant at the 5% level of confidence. Kagan (1953) studied the effects of a parents' course in vocational guidance and found that the course benefited parents by helping them identify their childrens' vocational problems, recognize their child's strengths and weaknesses, understand their role in their child's career planning, and better utilize community resources.

III. Group Procedures With Teachers

Recently concern for the effect of the teacher's personality on the learning environment has increased and with this increase has come an interest in improving teacher effectiveness through better self-understanding. Strickler (1957) believes that group discussion of problems encountered in practice teaching is an essential part of teacher preparation. Waldoketter (1962) conducted group counseling with African student teachers and found that experimental

groups differed significantly from controls on academic improvement. Symonds (1955) is of the opinion that the teacher's personality has a direct impact on the nature of interpersonal relationships in the classroom and teaching effectiveness. He recommends that teachers participate in group counseling to maximize teaching effectiveness. Berman (1954) has worked in group counseling sessions with educators and believes such sessions enhance the effectiveness of teachers. Long-standing conflicts with parental-authority figures, ambivalent attitudes toward sibling-peer figures and acting-out tendencies are explored in such groups.

Getting Acquainted In a New Group
Clarence A. Mahler

Once the purpose of a group meeting has been established with the members, then the leader moves on to helping the group to get to know each other better. Depending on the degree to which the members already know each other and even if they are quite well acquainted, it is important to start in and be sure that everyone knows each one by name and begins to know each individual personally. In helping individuals learn to talk about their own real feelings it is necessary to facilitate this habit. Thus, it is important to begin discussions on areas and topics that the individual can very surely answer. So in introducing themselves it is advisable to have them give more than their names. The kind of information you ask from each individual should depend considerably on the purpose of the group, but very essentially it is to provide some background of understanding each other that the members do not have concerning one another.

Examples: In asking for introductions the leader may make some suggestion similar to the following:

1. I would like each of you to introduce yourself and share with the group anything you wish about yourself and take a full two minutes to do so.

2. Let's each introduce ourselves with our name and give the number of brothers and sisters we have in our own family and their ages.

3. I'd like you to introduce yourselves and tell us how long you've lived in this community and how you feel about living here.

The main purpose of asking for more information than the name alone is to begin to help each person share some of himself with the group. While the leader should have no compulsion to get quiet members to talk, it certainly is helpful to give them the opportunity to learn to talk where this is needed. Once again the leader is alert to how the individual members introduce themselves, how much they are willing to share in the first session with one another, the kinds of attitudes they have toward the topic proposed, the kind of attitudes they have toward themselves and other people. All this gives the leader cues as to steps that the group may take next.

By the time a group has finished giving their introductions and have discussed the possible purposes for their meeting, the leader should have many cues, from his careful listening, as to how fast he can begin with this group and as to the directions and ways in which the group is ready to begin working. The more verbally fluent and less disturbed the group members are, the more likely they are to be able to carry the ball with less structure and less help from the leader. Thus, it is necessary for the counselor to assess how strong a group does this appear to be? How able will they be to get off the ground on their own, or will they need help from the leader? All these are questions that are answered for the leader during the process of the first session. Sometimes it is possible to make an estimation of this before they come in, but usually the leader is working at this during the introduction of the first session. It is desirable for the leader to introduce himself and give as much, if not more, data on himself than the group members have so they begin to get to know the leader as a person. It is also advisable to share with them your hopes for the group, your goals. This should not be done ahead of time, but after the students have given their own ideas. There is no room in group work for sneaking up on people or getting them in groups to straighten them out, and other such manipulative purposes. Certainly it is true that the group counselor hopes that his efforts

will help individuals toward more effective behavior, but not by manipulating them regardless of their own desires and wishes. On every step of the way the basic orientation of the counselor toward human beings will determine how he works. This was one of our main reasons for discussing the basic philosophy of working with people in an early chapter. It is out of your basic attitude toward people that the techniques and procedures develop.

By the end of the first session the counselor should have a good idea of the working speed of his group, the degree to which they will be able to handle concepts intellectually, the degree to which they are emotionally mature or immature, the degree to which they are able to discuss problems and solve problems, and out of this will proceed the second session. Group leaders vary as to whether they feel like giving a summary at the end of each session. I prefer not to do so, but in early structuring of the group it is quite permissable, for example, to say, "Well, we got a start today, now what about next time?" And then get from a number of the people, "Well, we'll just come and start talking." In other words, you may try to facilitate the beginning of the second session by clarifying, "Now, are we all sure why we are here?" and other means to summarize and try to get a concensus of the group members.

<center>Beginning the First Group Session
Clarence A. Mahler</center>

Many fine individual counselors who begin to plan trying group counseling for the first time find the problem of how to begin a session rather perplexing in contrast to their confidence in beginning an individual session with a student. Actually, the basic principles underlying the beginning of a counseling session with an individual student are very much the same for group counseling. Two of the basic purposes for the first interview are to clarify the desires of the client as to what the expects from the counseling relationship, and secondly to establish a working relationship that will enable the counselee to return the next session and continue the process of working through either the problem, the growth process, or whatever it is they has come to counseling for. Thus, in a group setting it is well to begin with:

1. "Well, how come we are meeting here in this group?"
2. "We have talked some individually about why we might have a group like this, let's discuss it again, so we are all clear. Why do you think I invited you all here?"
3. "How come this group?"

In other words, the counselor by any use of questioning or other approaches tries to get from the group the clarification as to why they are coming to the group. This is important to do with the total group there, since in discussing the formation of a group with individuals they often get different perceptions of what the group is going to do and why they think they may participate. Secondly, even though the student may have agreed with you on the initial interview to come to the group session, it is important for him to now state publicly to the whole group why he thinks he is coming. This concept is based on the principle that we hold the counselee responsible for what he gets out of a group counseling experience, and therefore we want to know both in the beginning and any place along the line what the commitment of the person is to the group process.

A counselor should be alert as to the clarity with which each group member has for his purposes of being in the group. It is possible that some group members will say, "Well, I'm here, but I'm not quite sure why I'm here. I hope it may do some good." Others may be quite clear why they wish to attend a group but will usually not know what they may expect from a group. Sometimes it happens that in the process of asking a student to consider participating in a group that the student feels that this is really a strong request for him to do so, and therefore his real motivation is more to please the school authority than it is that he has decided clearly what he wishes from the group. Other than making a close observation of the way they start, it is not advisable to put too much pressure on at this time for a commitment to the process. The very fact that the student has shown up should be sufficient reassurance to the counselor, and he should not press for a strong commitment to change or to do better until a much stronger working relationship has been established.

While the students are discussing the whys and wherefores of their being in the group, the counselor is listening attentively to the ability of the youngsters to express themselves, to the degree to which they are ready to discuss their feelings and their behavior, and this should give the counselor considerable insight as to the speed with which the first session may progress. If the group as a whole are relatively clear as to their purpose for meeting, then the leader is ready to go on with the introductions and warming up process. If, on the other hand, there is considerable confusion and lack of clarity as to why they are meeting, it is often advisable to continue the process of exploring the

possible reasons why such a group of individuals might meet at all. Usually group counseling is not done on a forced basis and there is a volunteer option as to whether they attend or not. This can generally be stated, "Well, this is not something that you must do. It's one of our ways of trying to organize services in the school to be of help to various students." If the counselor is concerned about the lack of clarity on the part of a good portion of the group, it is quite feasible to challenge them to think it over before they return next time. It is important to be somewhat sure that most of the group members are reasonably clear on why they are attending such a group before we go to work. In this way the basic responsibility for deciding what they will get out of the group is clearly placed upon the students, although there is no reason to insist that they sign an oath of effort to satisfy the counselor's need to be sure that he can be helpful.

All groups, whether completely unstructured to highly structured, have a pattern of conduct and expectations that the members must learn. Groups vary like individuals to the extent to which they can carry the ball themselves. The strong groups will have some natural leaders that cover many of the roles that are carried on in groups, such as facilitation of discussion or clarification of issues. If these roles are not forthcoming from the individual members of the group, then the leader must, of necessity, help help members learn these roles.

A basic issue that is not always settled in the first session, but certainly is evident, is the degree to which intellectualization will be allowed by the leader. Many students, from their experiences in classes, have learned to discuss issues and general ideas without applying these to themselves. Therefore, it is important that the counselor have thought through his purposes for the group. If one of the basic purposes is to have them stand on their own perceptions and apply the group discussion to themselves, then it is important very early in the sessions to help them learn this. I am inclined not to want much intellectualization as a part of group counseling, and therefore as soon as I detect signs of it on the part of any member, I am very likely to gently but firmly call their attention to the fact. For example, one student begins a session by saying that he is very afraid of flunking out of school. This is early in the school year. One of the intellectualizers begins immediately by saying, "Well, everyone is afraid of flunking out of school and very few people do." If the discussion is allowed to go on in this matter, we will have a good discussion on why some youngsters flunk out of school and why some don't. The basic issue, however, is what is each individual going to do about his own school work rather than what some or most students are doing about it. Thus, I am likely to pin the individual down, "Is it your own school work that you are concerned about?" or to stop the person that immediately wants to over-generalize, and protect someone by saying, "Well, actually here he is giving us his own fear of flunking out of school rather than our discussing about how people flunk out of classes in general."

Another example of intellectualization is where someone says, "I am having a great deal of trouble with my parents. I just cant seem to get along with them." Another group members comes in, "Well, all adolescents have trouble with parents." This obviously isn't too helpful and certainly isn't helpful to the particular individual, so as the leader I am inclined to bring the issue back to bear on the particular person that brought it up. I may question them thus, "Are you telling us that you want to learn how to work with your parents more effectively?" Or, "You seem to have a very rough situation here, what do you feel like doing about it?"

Thus, gently but firmly the individuals in the group are helped to see that

when we are here we will be discussing the things that are very pertinent to us
and how we are handling life, not abstract ideas of democracy, parenthood,
courtship, school work, and the like. Certainly there is no harm done in a
free discussion on topics, an oftentimes an important national event will set
off a discussion for most of the period. A counselor should be flexible enough
to understand whether the youngsters are meaningfully discussing a topic of
national importance and concern to them, or is this a rather evasive way of
avoiding getting to themselves? The counselor should be able to determine the
meaning of this behavior. Quite often after a real good session in which the
group has moved very fast on topics or problems, the next session will have much
more of a plateau effect and they may stay on safe issues and non-personal issues.
Here again the counselor should not be in a great hurry to keep their nose to
the grindstone. He certainly should be aware that this kind of behavior has
meaning. If by the end of the period they have spent a great deal of it on in-
tellectual philosophizing, then the counselor might summarize by saying, "Well,
today we certainly have talked about everything but ourselves, haven't we?"

                           Clarence A. Mahler

PARTICIPATION

Dear Parent:

This year the parents of the first grade children in our school are being invited to participate in a series of parent-group discussions. The purpose of these discussions is to enable parents to learn how they can be of the greatest help to their first grade child as he encounters academic work for the first time and as he enters a significant phase of educational development. There will be opportunity to share experiences with one another under the leadership of a pupil personnel specialist. Opportunity will be presented for discussion of growth patterns in children, children's reactions to the more academically demanding tasks of the first grade, their physical needs in relation to the demands of the school, and a variety of other topics in which many parents will be interested.

A series of four meetings is planned, and group size will be limited to twelve parents. If more than one group is necessary, they will be formed as needed. We should like both interested mothers and fathers to participate. Meetings are being scheduled in the evening to make it more possible for working parents to attend.

Please indicate your interest by marking the appropriate places on the enclosed postcard and return it to us as quickly as possible. This is the first time the school has tried this procedure with parents, and we are hopeful that you will find it of value.

Sincerely,

Enclosure

Grp 764.I.1

(Invitation Letter "I")

SUGGESTED LETTER TO SOLICIT

HIGH SCHOOL PARENT PARTICIPATION

Dear Parent:

As your child enters the (ninth) (tenth) grade the pressures on him to make appropriate decisions about his educational or vocational future increase in many ways. We feel that it is important for a child to be informed on this matter, and that it is equally important for parents to understand their role in the vocational and educational choices made by their children. For this reason we are scheduling a series of seven meetings for parents interested in understanding more about the kinds of factors which are important in this kind of decision making. Parent group size will be held to a maximum of twelve so that there will be ample opportunity for parents to interact with each other and with the group discussion leader. Leadership will be provided by school counselors. As many groups will be formed as are necessary to accommodate interested parents. Meetings will be held in the evening in order to permit the attendance of both parents. Please indicate your willingness to attend by completing the enclosed postcard and returning it as quickly as possible to us.

Sincerely,

Enclosures

GRP 764.I.9

(Follow-up Letter "P")

SUGGESTED COVER LETTER TO ACCOMPANY QUESTIONNAIRE

MATERIALS SENT TO PARENTS PARTICIPATING IN GROUP DISCUSSIONS

Dear Parent:

We are delighted that you are planning to participate in the parent discussion groups at your school. We have enrolled you in a group meeting on _____ evening at _____P.M. The first meeting will be held on _____.

In order to assist the schools to determine whether such meetings constitute a worthwhile expenditure of time both for parents and school personnel, it is necessary to attempt a systematic evaluation of them. A meaningful evaluation requires that information be collected from parents before the discussion groups start and after they are completed. We hope each parent will help by responding to the enclosed materials. Please follow the directions on each of the two enclosed questionnaires and record your answers directly on the answer sheet using any soft black pencil. Please return these materials in the enclosed envelope. They are going directly to UCLA where the data will be processed.

We are looking forward to meeting with you and sincerely hope that you will feel that your time has been well spent.

Sincerely,

Enclosures

GRP 764.P

(Follow-up Letter "N")

SUGGESTED LETTER TO ACCOMPANY QUESTIONNAIRE

MATERIAL TO NON-PARTICIPATING PARENTS

Dear Parent:

Our school is cooperating with UCLA and the U.S. Department of Health, Education and Welfare in an important study of beliefs and attitudes toward public education and children. The basic purpose of this study is to determine the attitudes of several important groups, including parents, toward various phases of public education. Through study of the resulting data, information useful in making appropriate changes in public education can be obtained.

These materials are being sent to the parents of (first) (seventh) (ninth) (Tenth) graders in the District. This envelope contains two copies of the School Opinion Survey, two copies of the (Family Life Attitude Inventory) (Educational-Vocational Plans Inventory), and a stamped return envelope. We hope that each parent will independently complete one of each of the two questionnaires, put the completed forms in the stamped envelope and drop them in the mail. Please use a soft black pencil, and be sure to print your name on the forms.

We realize that this is an imposition on your personal time, but hope that, in view of the importance of the study, you will complete and return the enclosed materials.

Sincerely,

Enclosures

GRP 764.N

(Follow-up Letter "W")

SUGGESTED COVER LETTER TO ACCOMPANY QUESTIONNAIRE

MATERIALS SENT TO PARENTS PLACED IN "WAIT" GROUPS

Dear Parent:

We are delighted that you are planning to participate in the parent discussion groups at your school. In fact, so many parents have indicated a desire to participate that it has been necessary to delay half of the groups until the next semester. The group for which you have been scheduled will hold its first meeting in January. You will be informed of the exact time and place later in the semester.

In order to assist the schools to determine whether such meetings constitute a worthwhile expenditure of time both for parents and school personnel, it is necessary to attempt a systematic evaluation of them. A meaningful evaluation requires that information be collected from parents before the discussion groups start and after they are completed. We hope each parent will help by responding to the enclosed materials. Please follow the directions on each of the two enclosed questionnaires and record your answers directly on the answer sheet using any soft black pencil. Please return these materials in the enclosed envelope. They are going directly to UCLA where the data will be processed.

We are looking forward to meeting with you and sincerely hope that you will feel that your time has been well spent.

Sincerely,

Enclosure

GRP 764.W

CHECK-OFF FORM A

GROUP SET UP PROCEDURE

Check off each box
when step is **complete**

☐   **Step 1**   Prepare Student-Parent List.

☐   **Step 2**   Complete Supply Requisition: number of students_____;
of parents_____.

☐   **Step 3**   Transmit completed List and Supply Requisition to Center.

☐   **Step 4**   Verify that requisitioned supplies were received as
ordered. Notify Center of any errors.

☐   **Step 5**   Secure administrative approval of Invitation Letter
and Follow-up Letters.

☐   **Step 6**   Reproduce required amounts of these letters. (Amounts:
I_____; P_____; N_____).

☐   **Step 7**   Have these letters signed (if not signed on stencil).

☐   **Step 8**   Address two sets of envelopes to parents on List.

☐   **Step 9**   Stuff first mailing: enclose (a) Invitation Letter
and (b) Post Card.

☐   **Step 10**   Mail: record date mailed here:_____.

CHECK-OFF FORM A (Cont.)

☐   Step 11   Wait two weeks.

☐   Step 12   Count affirmative replies. Write number here_____.
                  (These are "Acceptants".)

☐   Step 13   If above number is greater than 60, randomly select
                  half of acceptants and assign to "wait" group.

☐   Step 14   If above number is less than 40, select an additional
                  school and go through this entire procedure with a
                  similar Check-off Form A.

☐   Step 15   Enroll acceptants not assigned to a Wait Group in
                  groups of 12 to 15 according to evening preferred.
                  Number of groups was_____.

☐   Step 16   Assign a number (e.g. 1, 2, 3, etc.) to each group.
                  This number is to be used in all correspondence,
                  ratings, etc., concerning that group.

☐   Step 17   Write number of group to which each acceptant was
                  assigned in upper right corner of his reply card or slip.

☐   Step 18   Return all Reply cards or slips to Center. THIS IS
                  ESSENTIAL.

☐   Step 19   Stuff second mailing for Immediate Acceptants Only.
                  (Procedure for "Wait" acceptants and non-participants
                  is found on Check-Off Form B.) Enclose Follow-Up
                  Letter P. Indicate time and day of week assigned
                  group meets.

☐   Step 20   Mail: record date mailed here:_____.

☐   Step 21   Make follow-up call to each acceptant 1 to 2 days
                  before first meeting. Number reached_____.

☐   Step 22   PROCEED TO CHECK-OFF FORM B.

SCHOOL OPINION SURVEY

John K. Tuel and Merville C. Shaw

U.C.L.A. Guidance Project

The purpose of this survey is to determine the opinions of individuals with respect to a variety of factors that relate to how public schools operate. You may feel that you do not have adequate knowledge of all of the questions asked, but please answer all questions on the basis of the opinions you have formed at this time.

Mark your answers with a soft black pencil. If you change your mind about an answer after you have already marked it be sure to erase your first answer completely.

In this section read each item then blacken one of the answer spaces to that question. Blacken A if you *Disagree strongly*, B if you *Disagree* (mildly), C if you are *Indifferent*, D if you *Agree* (mildly) or E if you *Agree strongly*.

NAME_____   Sex ____ Male   Female

						Disagree strongly	Disagree	Indifferent	Agree	Agree strongly

Section One

1. The most important task of the school is to help children to understand the world in which they live.	A	B	C	D	E
2. The individual desires and interests of students should in no way affect the construction of the curriculum.	A	B	C	D	E
3. Moral laws have a divine origin.	A	B	C	D	E
4. Education is essentially a process in which the teacher helps the student realize his potential self.	A	B	C	D	E
5. The power of judgment is by nature equal in all men.	A	B	C	D	E
6. We live in a God-centered universe.	A	B	C	D	E
7. The real value of the curriculum depends on the changes it brings about in the behavior and lives of the students.	A	B	C	D	E
8. Controversial issues should not be discussed in the classroom.	A	B	C	D	E
9. Education need not be religiously oriented to be sound.	A	B	C	D	E
10. The best discipline is for a child to be brought to realize the natural consequences of his behavior.	A	B	C	D	E
11. The only objective of the school is intellectual development.	A	B	C	D	E
12. Knowledge and truth are relative not absolute.	A	B	C	D	E
13. An individual's feelings of adequacy about himself will be directly reflected in the effectiveness of his behavior.	A	B	C	D	E
14. It is best to ignore feelings and let the facts speak for themselves.	A	B	C	D	E
15. There is a Supreme Being.	A	B	C	D	E
16. Enjoyment of learning for the sake of learning is an important educational goal.	A	B	C	D	E
17. Teachers need the right to administer corporal punishment to maintain discipline.	A	B	C	D	E
18. Differences among human beings are usually superficial.	A	B	C	D	E
19. Truth is relative; it is never absolute.	A	B	C	D	E
20. Teachers should concentrate on developing skills, especially critical thinking.	A	B	C	D	E
21. It is not the teacher's job to determine guilt or give out punishment.	A	B	C	D	E
22. The teacher should not have to be concerned about motivation.	A	B	C	D	E
23. Moral law can be safely grounded only in religion.	A	B	C	D	E
24. The teacher's primary job is to help each child achieve his own potential.	A	B	C	D	E
25. Punishment seldom produces the educational results it is intended to produce.	A	B	C	D	E
26. A child's interest in a subject is unrelated to how well he does in it.	A	B	C	D	E
27. All moral laws have grown out of human experience and are thus man-made.	A	B	C	D	E
28. A good education is a broad education.	A	B	C	D	E
29. A child's feelings have no bearing on his learning.	A	B	C	D	E
30. Moral laws should change as social conditions change.	A	B	C	D	E
31. Schools exist primarily for the purpose of helping children realize their own individual potential.	A	B	C	D	E
32. It is best not to make exceptions to the rules for individual cases.	A	B	C	D	E
33. Moral laws are universal and unchanging.	A	B	C	D	E

Section Two

In this section read each item and indicate by blackening one of the answer spaces what CHANGES, if any, you believe should be made to improve public education. Take number 1 (individual counseling of pupils) for example. If you believe there should be *Much Less* than now you should blacken A; if you believe there should be a *Little Less* than now, you should blacken B; if you believe it should be *Just the Same* as now, blacken C; if a *Little More* than now, blacken D; and if *Much More* than now, blacken E.

	Much Less	Less	Same	More	Much More
1. Individual counseling of pupils.	A	B	C	D	E
2. Competitive sports.	A	B	C	D	E
3. Pay for administrators.	A	B	C	D	E
4. Student government.	A	B	C	D	E
5. Hours spent in school.	A	B	C	D	E
6. Use of teaching machines.	A	B	C	D	E
7. Strict enforcement of school rules.	A	B	C	D	E
8. Counseling on personal problems.	A	B	C	D	E
9. Team sports.	A	B	C	D	E
10. Clerical help for teachers.	A	B	C	D	E
11. Shop and crafts classes.	A	B	C	D	E
12. Weeks in the school year.	A	B	C	D	E
13. Personality testing.	A	B	C	D	E
14. Strictness of discipline.	A	B	C	D	E
15. Attention to individuality of pupils.	A	B	C	D	E
16. Extra-curricular activities.	A	B	C	D	E
17. Pay for teachers.	A	B	C	D	E
18. Student organizations.	A	B	C	D	E
19. Emphasis on great literature.	A	B	C	D	E
20. Use of IQ tests.	A	B	C	D	E
21. Spanking of misbehaving pupils.	A	B	C	D	E
22. Interest by parents in school matters.	A	B	C	D	E
23. Time allotted to outdoor play.	A	B	C	D	E
24. Help for emotionally disturbed pupils.	A	B	C	D	E
25. Books in library.	A	B	C	D	E
26. Longer class periods.	A	B	C	D	E
27. Use of standardized tests.	A	B	C	D	E
28. Stringent laws against truancy.	A	B	C	D	E
29. Parent-teacher conferences.	A	B	C	D	E
30. P.T.A. activities.	A	B	C	D	E
31. Educational research.	A	B	C	D	E
32. Methods courses for teachers.	A	B	C	D	E
33. Free periods.	A	B	C	D	E

	Much Less	Less	Same	More	Much More
34. State regulation of education.	A	B	C	D	E
35. Teaching of morals in school.	A	B	C	D	E
36. Orientation for parents of new pupils.	A	B	C	D	E
37. Grading on the curve.	A	B	C	D	E
38. School psychologists.	A	B	C	D	E

Section Two

In this section read each item and indicate by blackening one of the answer spaces what **CHANGES**, if any, you believe should be made to improve public education. Take number 1 (individual counseling of pupils) for example. If you believe there should be *Much Less* than now you should blacken A; if you believe there should be a *Little Less* than now, you should blacken B, if you believe it should be *Just the Same* as now, blacken C; if a *Little More* than now, blacken D; and if *Much More* than now, blacken E.

Column headers: Much Less (A), Less (B), Same (C), More (D), Much More (E)

1. Individual counseling of pupils.
2. Competitive sports.
3. Pay for administrators.
4. Student government.
5. Hours spent in school.
6. Use of teaching machines.
7. Strict enforcement of school rules.
8. Counseling on personal problems.
9. Team sports.
10. Clerical help for teachers.
11. Shop and crafts classes.
12. Weeks in the school year.
13. Personality testing.
14. Strictness of discipline.
15. Attention to individuality of pupils.
16. Extra-curricular activities.
17. Pay for teachers.
18. Student organizations.
19. Emphasis on great literature.
20. Use of IQ tests.
21. Spanking of misbehaving pupils.
22. Interest by parents in school matters.
23. Time allotted to outdoor play.
24. Help for emotionally disturbed pupils.
25. Books in library.
26. Longer class periods.
27. Use of standardized tests.
28. Stringent laws against truancy.
29. Parent-teacher conferences.
30. P.T.A. activities.
31. Educational research.
32. Methods courses for teachers.
33. Free periods.
34. State regulation of education.
35. Teaching of morals in school.
36. Orientation for parents of new pupils.
37. Grading on the curve.
38. School psychologists.
39. Efforts to prevent school drop-outs.
40. Individual attention for each pupil.
41. Use of objective tests.
42. Closer home-school relationships.
43. Extent of counselor education.
44. Field trips.
45. Teaching of abstract ideas.
46. Consumer education.
47. Writing of themes.
48. Child-study training.
49. Encouragement of creativity.
50. Co-educational physical education.
51. Large school districts.
52. Incidental expenses of education paid by the school.
53. Emphasis on social studies.
54. Free medical care for students.
55. School social workers.
56. Group projects.
57. Summer school for acceleration.
58. Lighting of classrooms.
59. Group discussions with parents.
60. Team teaching.
61. Home visits by teachers.
62. Autonomy of local school boards.
63. Attention given to gifted children.
64. Training in art and music.
65. Foreign language courses.
66. Stress on mathematics.

SCHOOL OPINION SURVEY
John K. Tuel and Merville C. Shaw

School of Education, U.C.L.A.

PLEASE DO NOT WRITE IN THIS BOX

0	1	2	3	4		5	6	7	8	9		0	1	2	3	4		5	6	7	8	9
B	G	F	M	TM		TF	CM	CF	AM	AF												

The purpose of this survey is to determine the opinion of individuals with respect to a variety of factors that relate to how public schools operate. You may feel that you do not have adequate knowledge of all of the questions asked, but please answer all questions on the basis of the opinions you have formed at this time. Please mark your answers with a soft black pencil. If you change your mind about an answer after you have already marked it be sure to erase your first answer completely.

Section One

In this section read each item then blacken one of the 5 answer spaces to the left of that question. Blacken A if you Disagree strongly, B if you Disagree (mildly), C if you are Uncertain, D if you Agree (mildly) or E if you Agree strongly. For example, look at SAMPLE ITEM 0. If you chose C (Uncertain), your mark next to that item should look like this:

Disagree Strongly — A
Disagree — B
Uncertain — C
Agree — D
Agree Strongly — E

0. SAMPLE ITEM

1. The most important task of the school is to help children to understand the world in which they live.

2. The individual desires and interests of students should in no way affect the construction of the curriculum.

3. "Facts" are not fixed, but can change with the situation.

4. Education is essentially a process in which the teacher helps the student realize his potential self.

5. The power of judgment is by nature equal in all men.

6. The objective-scientific method is the best road to truth.

7. The real value of the curriculum depends on the changes it brings about in the behavior and lives of the students.

8. Controversial issues should not be discussed in the classroom.

9. Teachers should suggest problems and encourage pupils to find for themselves solutions which will work.

10. The best discipline is for a child to be brought to realize the natural consequences of his behavior.

11. The only objective of the school is intellectual development.

12. Knowledge and truth are relative, not absolute.

13. An individual's feelings of adequacy about himself will be directly reflected in the effectiveness of his behavior.

14. It is best to ignore feelings and let the facts speak for themselves.

15. The main purpose of education is to turn out active people who DO things.

16. Enjoyment of learning for the sake of learning is an important educational goal.

17. Teachers need the right to administer corporal punishment to maintain discipline.

18. Differences among human beings are usually superficial.

19. Schools should teach, not just known facts, but ways to discover new facts.

20. Teachers should concentrate on developing skills, especially critical thinking.

21. It is not the teacher's job to determine guilt or give out punishment.

22. The teacher should not have to be concerned about motivation.

23. Facts change as new knowledge is developed.

24. The teacher's primary job is to help each child achieve his own potential.

25. Punishment seldom produces the educational results it is intended to produce.

26. A child's interest in a subject is unrelated to how well he does in it.

27. There are really NO principles which are universal and unchanging.

28. A good education is a broad education.

29. A child's feelings have no bearing on his learning.

30. The most important objective of education is to teach effective problem solving skills.

31. Schools exist primarily for the purpose of helping children realize their own individual potential.

32. It is best not to make exceptions to the rules for individual cases.

33. Truth is relative; it is never absolute.

34. Schools should give students more training in self-discipline.

<u>CHECK-OFF FORM B</u>

<u>INDIVIDUAL DATA COLLECTION PROCEDURE</u>

Check off each box
when step is complete

☐   Step 1   Stuff second mailing <u>for</u> <u>Non-Participants</u> <u>Only</u>: enclose
(a) one (1) Follow-up letter "N," (b) Two* (2) copies of
SOS, (c) Two* (2) copies of FLAI, (d) one (1) UCLA
Return Envelope. *(Only One (1) copy of the SOS and FLAI
may be sent if you <u>know</u> there is only one parent in the
family.)

☐   Step 2   <u>If</u> <u>you</u> <u>have</u> <u>formed</u> "<u>wait</u>" <u>groups</u>, Complete Step 1 for
them with this <u>one</u> <u>change</u>: Enclose Follow-up Letter "W."
(You will have to prepare these letters after you see a
need for them.)

☐   Step 3   Mail: record date mailed here_____.

☐   Step 4   Administer SOS to principal and <u>all</u> teachers in a faculty
meeting, <u>prior</u> to the first parent group session. (Give
principal and each teacher a blank envelope into which to
seal completed form. Ask teachers and principal to sign
names but stress the security of all responses and
desired frankness. Ask a well-liked teacher to collect
envelopes, place them in a large envelope addressed to
UCLA, seal it in their presence and drop it in the mail.)
Record date administered here_____.

☐   Step 5   Administer SOS and FLAI to participants during <u>first</u> <u>ses-</u>
<u>sion</u> of your <u>first</u> group. (Give each participant a blank
envelope. Ask them to complete, sign and seal forms in
envelope. Stress security of responses and desired frank-
ness. Collect envelopes and, while parents are looking,
place in large envelope addressed to UCLA. Mail after
session closes.) Date mailed_____.

☐   Step 6   Complete Step 5 for your <u>second</u> group. Date mailed_____.

CHECK-OFF FORM B (Cont.)

☐ Step 7   If you have "wait" groups, indicate here the date you
expect their first session to be held._____

☐ Step 8   When you have completed Steps 5 and 6 for your <u>Immediate</u>
groups (do not include "wait" groups) transmit this
completed Form B to the Center, and <u>Proceed</u> <u>to</u> <u>Check-Off</u>
<u>Form</u> <u>C</u>.

CHECK-OFF FORM B

INDIVIDUAL DATA COLLECTION PROCEDURE

Check off each box
when step is complete

☐ Step 1 Stuff second mailing for Non-Participants Only: enclose
(a) one (1) Follow-up Letter "N," (b) Two* (2) copies of
SOS, (c) Two* (2) copies of EVPI-P (Parent Form), (d)
one (1) UCLA Return Envelope. *(Only One (1) copy of
the SOS and EVPI may be sent if you know there is only
one parent in the family.)

☐ Step 2 If you have formed "wait" groups, complete Step 1 for them
with this one change: Enclose Follow-up Letter "W." (You
will have to prepare these letters after you see a need
for them.)

☐ Step 3 Mail: record, date mailed here_____.

☐ Step 4 Administer SOS to principal and all teachers in a faculty
meeting, prior to the first parent group session. (Give
principal and each teacher a blank envelope into which to
seal completed form. Ask teachers and principal to sign
names but stress the security of all responses and
desired frankness. Ask a well-liked teacher to collect
envelopes, place them in a large envelope addressed to
UCLA, seal it in their presence and drop it in the mail.)
Record date administered here_____.

☐ Step 5 Administer SOS and EVPI-S (Student Form) to all first
year high school students prior to the first parent group
session. (Be sure the students print their names on both
forms. Considerable proctoring will be necessary to see
that forms are marked properly and to encourage the unmo-
tivated.) Collect and transmit to the Center. Record
date administered here _____.

☐ Step 6 Administer Kuder to all children whose parents are partic-
ipants (unless Kuder scores are already available for them)
prior to the first parent group session. Transmit scores
to Center. Keep profiles for use in groups. Date
administered_____.

CHECK-OFF FORM B (Cont.)

☐ Step 7   Administer SOS and EVPI-P (Parent Form) to participants
            during first session of your first group. (Give each
            participant a blank envelope. Ask them to complete,
            sign and seal forms in envelope. Stress security of
            responses and desired frankness. Collect envelopes and,
            while parents are looking, place in large envelope addressed
            to UCLA. Mail after session closes.) Date mailed_____.

☐ Step 8   Give a copy of Kuder to each participant in Group #1 during
            their second session to take home, complete, score and
            bring back to third session.

☐ Step 9   Have participants draw own profiles during third session.
            Transmit scores to Center. Let parents keep profiles.
            Date mailed_____.

☐ Step 10   Complete Step 7 for your second group. Date mailed_____.

☐ Step 11   Complete Steps 8 and 9 for your second group. Date
            mailed_____.

☐ Step 12   If you have "wait" groups, indicate here the date you
            expect their first session to be held_____.

☐ Step 13   When you have completed Steps 7,8,9,10 and 11 for your
            immediate groups (do not include "wait" groups) transmit
            this completed Form B to the Center, and Proceed to
            Check-Off Form C.

FAMILY LIFE ATTITUDE INVENTORY (UCLA Guidance Project Modification)

Please read each statement below, then decide whether you *Disagree strongly*, are *Indifferent*, *Agree Strongly* or are in between. Then, mark the appropriate answer space opposite each statement. These statements represent only *opinions*, and there are no right or wrong answers. Please make heavy, black pencil marks, and clean, clear erasures.

GRP 764.2

NAME _____

	Disagree Strongly	Disagree	Indif- ferent	Agree	Agree Strongly
1. Children should be allowed to gripe about rules which their parents make.					
2. Good parents should shelter their children from life's little difficulties.	:::::	:::::	:::::	:::::	:::::
3. The home is the only thing that matters to a good parent.	:::::	:::::	:::::	:::::	:::::
4. Some children are just so bad that they must be taught to fear adults for their own good.	:::::	:::::	:::::	:::::	:::::
5. People who think they can get along in marriage without arguments just don't know the facts.	:::::	:::::	:::::	:::::	:::::
6. Parents should adjust to the children somewhat rather than always expecting the children to adjust to the parents.	:::::	:::::	:::::	:::::	:::::
7. A child should be taught to avoid fighting no matter what happens.	:::::	:::::	:::::	:::::	:::::
8. More parents should teach their children to have unquestioning loyalty to them.	:::::	:::::	:::::	:::::	:::::
9. Children shouldn't be confused by letting them learn things that differ from what their parents have told them.	:::::	:::::	:::::	:::::	:::::
10. The things children ask of parents after a hard day are enough to make anyone lose his temper at times.	:::::	:::::	:::::	:::::	:::::
11. A child will be grateful later on for strict training.	:::::	:::::	:::::	:::::	:::::
12. A young child should be protected from hearing about sex.	:::::	:::::	:::::	:::::	:::::
13. Children would be happier and better behaved if parents would show an interest in their affairs.	:::::	:::::	:::::	:::::	:::::
14. "Let sleeping dogs lie" is the best rule to follow with children's worries.	:::::	:::::	:::::	:::::	:::::
15. Parents should ask for their children's opinions and take them into account when something which directly concerns the children is decided.	:::::	:::::	:::::	:::::	:::::
16. Parents should do their best to avoid any disappointment for their children.					
17. The people who want lots of parties seldom make good parents.	:::::	:::::	:::::	:::::	:::::
18. It is frequently necessary to drive the mischief out of a child before he will behave.	:::::	:::::	:::::	:::::	:::::
19. Sometimes it's necessary for a person to tell off his spouse in order to get his rights.					
20. Parents must earn the respect of their children by the way they act.	:::::	:::::	:::::	:::::	:::::
21. A child should be taught always to come to his parents or teachers rather than to fight when he is in trouble.	:::::	:::::	:::::	:::::	:::::
22. The child should be taught to revere his parents above all other grown-ups.	:::::	:::::	:::::	:::::	:::::
23. A parent should never be made to look wrong in a child's eyes.	:::::	:::::	:::::	:::::	:::::
24. There's nothing that upsets parents more than a noisy family.	:::::	:::::	:::::	:::::	:::::
25. Strict discipline develops a fine strong character.	:::::	:::::	:::::	:::::	:::::
26. It is very important that young boys and girls not be allowed to see each other completely undressed.	:::::	:::::	:::::	:::::	:::::
27. Laughing at children's jokes and telling children jokes makes things go more smoothly.	:::::	:::::	:::::	:::::	:::::
28. Children's problems that are left alone most often go away by themselves.	:::::	:::::	:::::	:::::	:::::
29. A child has a right to his own point of view and should be allowed to express it.	:::::	:::::	:::::	:::::	:::::
30. A child should be protected from jobs which might be too tiring or hard for him.	:::::	:::::	:::::	:::::	:::::
31. Parents have to choose between caring for their family and hob-nobbing around with neighbors and friends.	:::::	:::::	:::::	:::::	:::::
32. A wise parent will teach a child early just who is boss.	:::::	:::::	:::::	:::::	:::::
33. No matter how well a married couple love one another there are always differences which cause irritation and lead to arguments.	:::::	:::::	:::::	:::::	:::::
34. Children are too often asked to do all the compromising and adjusting and that is not fair.	:::::	:::::	:::::	:::::	:::::
35. There is no good excuse for a child hitting another child.	:::::	:::::	:::::	:::::	:::::
36. A child soon learns that there is no greater wisdom than that of his parents.	:::::	:::::	:::::	:::::	:::::
37. There is no excusing someone who upsets the confidence a child has in his parents' way of doing things.	:::::	:::::	:::::	:::::	:::::
38. It's natural for a parent to "blow his top" when children are selfish and demanding.	:::::	:::::	:::::	:::::	:::::
39. Children who are held to firm rules grow up to be the best adults.	:::::	:::::	:::::	:::::	:::::
40. Children who take part in sex play become sex criminals when they grow up.	:::::	:::::	:::::	:::::	:::::
41. Parents who are interested in hearing about their children's parties, dates, and fun, help them grow up right.	:::::	:::::	:::::	:::::	:::::
42. Children pester you with all their little upsets if you aren't careful from the first.	:::::	:::::	:::::	:::::	:::::
43. A child's ideas should be seriously considered in making family decisions.	:::::	:::::	:::::	:::::	:::::
44. Parents should know better than to allow their children to be exposed to difficult situations.	:::::	:::::	:::::	:::::	:::::
45. Too many parents forget that their place when they are not working, is with the family.	:::::	:::::	:::::	:::::	:::::
46. Children need some of the natural meanness taken out of them.	:::::	:::::	:::::	:::::	:::::
47. There are some things which just can't be settled by a mild discussion.	:::::	:::::	:::::	:::::	:::::
48. As much as is reasonable, a parent should try to treat a child as an equal.	:::::	:::::	:::::	:::::	:::::
49. Children should not be encouraged to box or wrestle because it often leads to trouble or injury.	:::::	:::::	:::::	:::::	:::::

	Disagree Strongly	Disagree	Indifferent	Agree	Agree Strongly

50. Parents deserve the highest esteem and regard of their children.

51. It's best for the child if he never gets started wondering whether his parent's views are right or not.

52. There are times when any parent gets to the point where he can't stand his family a moment longer.

53. Most children should have more discipline than they get.

54. Sex is one of the greatest problems to be contended with in children.

55. If parents would have fun with their children, the children would be more apt to take their advise.

56. If a child has upset feelings it is best to leave him alone and not make it look so serious.

57. When a child is in trouble he ought to know that he won't be punished for talking about it with his parents.

58. Children should be kept away from all hard jobs which might be discouraging.

59. A good parent will find enough social life within the family.

60. It is sometimes necessary for the parent to break the child's will.

61. It's natural to have quarrels when two people who both have minds of their own get married.

62. There is no reason for parents to have their own way all the time any more than for children to have their own way all the time.

63. Most parents prefer a quiet child to a "scrappy" one.

64. Loyalty to parents comes before everything else.

65. It is a very bad policy to let a child begin to have doubts about what his parents have told him.

66. A parent may need to "blow his top" once in a while around the home just to clear the air a bit.

67. Children are actually happier under strict training.

68. There is usually something wrong with a child who asks a lot of questions about sex.

69. When you do things together, children feel close to you and can talk more easily.

70. The trouble with giving attention to children's problems is that they usually just make up a lot of stories to keep you interested.

71. Children should be encouraged to express their opinions about anything that involves them.

72. A child is most lovable when he is small and helpless.

73. A person can't do a parent's job and have an active social life too.

74. Many children, like horses, must be broken in order to be trained.

75. A good argument now and then is a good way for people to settle their differences.

76. Parents should treat children with as much consideration and respect as they show to one another.

77. Children should be taught not hit back even if someone hits them.

78. A child should always love his parents above everyone else.

79. The child should not question the thinking of his parents.

80. A parent has a right to be angry and irritated when the family doesn't give him a chance to relax at home.

81. Severe discipline is essential in the training of children.

82. If children are not warned about sex they may indulge in harmful sex play.

83. It is good for parents and teenagers to have a friend-to-friend attitude.

84. Parents who start a child talking about his worries don't realize that sometimes it's better to just leave well enough alone.

85. Family life would be happier if parents made children feel that they were free to say what they think about anything.

86. Parents should try to prevent all difficulties which might make a child unhappy.

87. A good parent doesn't have time to join clubs or have other activities besides work and family responsibilities.

88. A good whipping now and then never hurt any child.

89. Even in marriage a person must fight for his rights at times.

90. Parents should respect the wishes of children just as much as they expect their wishes to be respected.

91. A good child doesn't fight with other children.

92. Children should be more concerned about their parents' happiness than about anything else.

93. A child's trust in his parent should be safeguarded better by not having so many people with different ideas around him.

94. Raising children is a nerve-racking job.

95. Firm enforcement of rules never really hurts a child.

96. Children who know a lot about sex become more curious and get into more trouble.

97. Parents should be playful rather than dignified with children.

98. Children can get into a bad habit of telling you all their problems if you make the mistake of getting them started.

POST-SERIES REACTION SHEET

GUIDANCE RESEARCH PROJECT
University of California at Los Angeles

For several weeks you have been participating in group discussions. We would like to know your reactions to this experience in order to plan for the future. Will you please respond frankly to the attached rating scale so that the reactions of all participants may be objectively evaluated. Should you run out of space, please feel free to continue on the back of this sheet or use additional paper.

1. Do you feel that the group discussions have been helpful to you?

    Not at all* _____ * _____ * _____ * _____ * Very much so
    　　　　　　1　　　2　　　3　　　4　　　5

    1a. If you checked 3, 4, or 5 above, please explain briefly in what ways the discussions have been helpful.

2. Have there been bad or negative results from your participation in the group discussions?

    Not at all* _____ * _____ * _____ * _____ * Very much so
    　　　　　　1　　　2　　　3　　　4　　　5

    2a. If you checked 3, 2, or 1 above, please explain briefly what negative results occurred.

3. Have there been any recent changes in your child's behavior around home and other out-of-school situations?

Not at all* _____ * _____ * _____ * _____ * Very much so
          1   2   3   4   5

    3a. If you checked 3, 4, or 5 above, have these changes been for the better_____ worse_____ Please explain briefly the nature of these changes.

4. Would you recommend participation in a similar group to friends who have children with academic problems?   yes_____
                                                  no_____

5. What specific aspects of the group discussions did you find to be least helpful (or possibly harmful)?

6. What specific aspects of the group discussions did you find to be most helpful?

7. Please write here and on the back any feelings or reactions about your experience in this group which you have not had an opportunity to express above.

Group #_____   School_____
                                        Consultant_____

Use separate form for   GROUP DATA COLLECTION PROCEDURE
each group.

Check off each box
when step is complete

☐ Step 1   Keep record of weekly attendance of each
            participant on Group Attendance Form.

☐ Step 2   At last session of this series give each parent
            a Post Series Reaction Sheet and an envelope.
            Have him complete, sign and seal it in envelope.
            Collect and, while parents watch, place envelopes
            in a large envelope addressed to the Center.
            Be sure to put your name and group number on the
            envelope.

☐ Step 3   After this session, mail Post Series Reaction
            Sheets to all parents not present at this last
            session who had attended two or more sessions.
            Include a note asking them to complete them and
            mail them to the Center in the enclosed UCLA
            envelopes.

☐ Step 4   Complete the Group Attendance Form for this group.

☐ Step 5   Complete the Counselor Reactions to Specific Groups
            Form for this group.

☐ Step 6   If this is your Last session for the school year,
            complete the General Counselor Reactions form.
            (This need be done only once for the year.)

☐ Step 7   Place the completed Group Attendance Form,
            Counselor Reactions to Specific Groups, General
            Counselor Reactions (if applicable), and this
            completed Check-Off Form C in the envelope
            containing the Parents Post Series Reactions
            Sheets, seal and mail to the Center. Date
            Mailed_____.
